File = README

D-BUS is a simple IPC library based on messages.

See <http://www.freedesktop.org/software/dbus/> for lots of documentation, mailing lists, etc.

Note
===

A core concept of the D-BUS implementation is that "libdbus" is intended to be a low-level API, similar to Xlib. Most programmers are intended to use the bindings to GLib, Qt, Python, Mono, Java, or whatever. These bindings have varying levels of completeness.

Configuration flags
===

These are the dbus-specific configuration flags that can be given to the ./configure program.

--enable-tests	enable unit test code
--enable-ansi	enable -ansi -pedantic gcc flags
--enable-verbose-mode	support verbose debug mode
--enable-asserts	include assertion checks
--enable-checks	include sanity checks on public API
--enable-xml-docs	build XML documentation (requires xmlto)
--enable-gcov	compile with coverage profiling
instrumentation (gcc only)	
--with-xml=libxml/expat	XML library to use
--with-gnu-ld	assume the C compiler uses GNU ld
[default=no]	
--with-tags[=TAGS]	include additional configurations
[automatic]	

File = README.cygwin

The cygwin dbus port is included in master branch of dbus git repository since 1.3.1.

The cygwin port of dbus is maintained by:

<http://sourceware.org/cygwinports/>

File = README.launchd

Launchd[1,2] replaces init, inetd and cron on Mac OS X since 10.4 "Tiger".

dbus uses this service to provide a common session bus address for each user

and so deprecates the X11 enabled dbus-launcher.

[1] <http://developer.apple.com/MacOSX/launchd.html>

[2] <http://launchd.macosforge.org/>

Setup

===

Configure with --enable-launchd and --without-x (X11 should not harm but it's

simply not necessary any more)

After installation, to prevent a reboot, load the dbus session starter into

launchd by executing:

```
$ launchctl load /Library/LaunchAgents/org.freedesktop.dbus-session.plist
```

You can change the launch agent dir via configure, but it's not recommended.

Make sure to execute the above line as the actual user for which you want to

use a session bus since launchd manages its agents on a per user basis.

How it works

===

Launchd allocates a socket and provides the unix path to it via the variable

DBUS_LAUNCHD_SESSION_BUS_SOCKET in launchd's environment. Every process

spawned by launchd (or dbus-daemon, if started by launchd) can access it through

its own environment. Other processes can query launchd for it by executing:

```
$ launchctl getenv DBUS_LAUNCHD_SESSION_BUS_SOCKET
```

However, this is normally done by the dbus client lib for you.

If launchd start dbus-daemon with a config file containing a "launchd:env=FOO"

address, as the default session config does with

env=DBUS_LAUNCHD_SESSION_BUS_SOCKET,

the daemon will get the file descriptor from launchd and start listening on it.

The environment variable is used to get the actual socket path which is passed

to every service spawned by dbus-daemon as a result from autolaunch messages.

Please note that it's not possible to start dbus-daemon manually when using a

"launchd:" address. Only child processes of launchd can access the above

mentioned file descriptor!

To create custom buses just set up an other launch agent. As a quick start copy

/Library/LaunchAgents/org.freedesktop.dbus-session.plist, change the label

to i.e. "org.freedesktop.dbus-foo" and change the SecureSocketWithKey value,

i.e. to "DBUS_LAUNCHD_FOO_BUS_SOCKET". This environment variable has to be set

in the config file for your new bus in the <listen> element (see session.config).

Then edit your /Library/LaunchAgents/org.freedesktop.dbus-foo.plist to start

dbus-daemon with "--config-file=/opt/local/etc/dbus-1/foo.conf" instead of

"--session". Now load the new plist onto launchd as described in the setup

section of this document.

Executing "launchctl export" should now give you two sockets, one in DBUS_LAUNCHD_SESSION_BUS_SOCKET and the new

DBUS_LAUNCHD_FOO_BUS_SOCKET.

To connect to this new bus use

"launchd:env=DBUS_LAUNCHD_FOO_BUS_SOCKET".

Since Mac OS X 10.5 "Leopard" you can also configure launchd to start dbus-daemon on demand as soon as some process connects to the socket.

Since

it's broken on 10.4 this feature is disabled per default. Look at

/Library/LaunchAgents/org.freedesktop.dbus-session.plist to change it.

On the client side, the envvar DBUS_SESSION_BUS_ADDRESS can be normally used

but if it's not set, launchd is queried for the session bus socket.

File = Readme.txt

Test suite from <http://csrc.nist.gov/cryptval/shs.html>

Sample Vectors for SHA-1 Testing

This file describes tests and vectors that can be used in verifying the correctness of

an SHA-1 implementation. However, use of these vectors does not take the place of validation obtained through the Cryptographic Module Validation Program.

There are three areas of the Secure Hash Standard for which test vectors are supplied: short messages of varying length, selected long messages, and pseudorandomly generated messages. Since it is possible for an implementation to correctly handle the hashing of byte-oriented messages (and not messages of a non-byte length), the SHS tests each come in two flavors. For both byte oriented and bit oriented messages, the message lengths are given in bits.

Type I Test: Messages of Varying Length

An implementation of the SHS must be able to correctly generate message digests for messages of arbitrary length. This functionality can be tested by supplying the implementation with 1025 pseudorandomly generated messages with lengths from 0 to 1024 bits (for an implementation that only hashes byte-oriented data correctly, 129 messages of length 0, 8, 16, 24, ..., 1024 bits will be supplied).

Type II Test: Selected Long Messages

Additional testing of an implementation can be performed by testing that the implementation can correctly generate digests for longer messages. A list of 100 messages, each of length > 1024 , is supplied. These can be used to verify the hashing of longer message lengths. For bit oriented testing the messages are from 1025 to 103425 bits long (length= $1025+i*1024$, where $0 \leq i < 100$). For byte oriented testing the messages are from 1032 to 103432 (length= $1032+i*1024$, where $0 \leq i < 100$).

Type III Test: Pseudorandomly Generated Messages

This test determines whether the implementation can compute message digests for messages that are generated using a given seed. A sequence of 100 message digests is generated using this seed. The digests are generated according to the following pseudocode:

```
procedure MonteCarlo(string SEED)
{
    integer i, j, a;
```

```

string      M;

M := SEED;
for j = 0 to 99 do {
    for i = 1 to 50000 do {
        for a = 1 to (j/4*8 + 24) do M := M || '0'; /*'0' is
the binary zero bit. */
        M := M || i;      /* Here, the value for 'i' is
expressed as a 32-bit word
and concatenated with 'M'. The first bit
concatenated with 'M' is the most
significant bit of
this 32-bit word. */
        M := SHA(M);
    }
    print(M);
}
}

```

NOTE: In the above procedure, || denotes concatenation. Also, M || i denotes appending the 32-bit word representing the value 'i', as defined in section 2 of the SHS. Within the procedure, M is a string of variable length. The initial length of 416 bits ensures that the length of M never exceeds 512 bits during execution of the above procedure, and it ensures that messages will be of a byte length. Each element printed should be 160 bits in length.

File formats:

There are two files included for each test type (bit-oriented and byte-oriented). One file contains the messages and the other file contains the hashes.

The message files provided use "compact strings" to store the message values. Compact strings are used to represent the messages in a compact form. A compact string has the form

$$z \ || \ b \ || \ n(1) \ || \ n(2) \ || \ \dots \ || \ n(z)$$

where $z \geq 0$ that represents the number of n , b is either 0 or 1, and each $n(i)$ is a decimal integer representing a positive number. The length of the compact string is given by the summation of the $n(i)$.

The compact string is interpreted as the representation of the bit string consisting of b repeated $n(1)$ times, followed by $1-b$ repeated $n(2)$ times, followed by b repeated $n(3)$ times, and so on.

Example:

M = 5 1 7 13 5 1 2
where z = 5 and b = 1. Then the compact string M represents the
bit string
11111110000000000000011111011
where 1 is repeated 7 times, 0 is repeated 13 times, 1 is
repeated 5 times,
0 is repeated 1 time, and 1 is repeated 2 times.

File = README.win

Windows port of the freedesktop.org D-Bus

Features and completeness

The windows port of dbus provides the dbus-1 library and mostly applications which are already available on unix. These applications are: dbus-daemon, dbus-launch, dbus-monitor and dbus-send. D-Bus comes with a test suite which is used on unix to guarantee production quality and this test suite runs mostly. There are some test not running yet and there is help needed to get them running.

Supported compilers

On windows Microsoft Visual Studio 2010 (Express and professional variants) and mingw-w64|32 are known to work.

Building

D-Bus can be built on windows using automake or cmake. See the file README for more information. Special cmake build instructions can be found in cmake/readme-cmake.txt

windbus and dbus4win Ports

The Windows ports from the windbus and dbus4win projects has been merged into the freedesktop git master branch, as applicable. The spec has been updated with windows specific stuff.

Tests

- dbus library check

```
bin\dbus-test.exe <build-root>\test\data
```

- bus daemon check

```
bin\bus-test.exe <build-root>\test\data
```

- check available names

```
bin\test_names.exe
```

- check if dbus-daemon is accessible

```
bin\dbus-send.exe --session --type=method_call --print-reply --
dest=org.freedesktop.DBus / org.freedesktop.DBus.ListNames method
return sender=org.freedesktop.DBus -> dest=:1.4 array [ string
"org.freedesktop.DBus"string ":1.4"]
```

- start session dbus-daemon

either by running

```
bin\dbus-launch
```

or

```
start bin\dbus-daemon --session
```

Before running these commands you may execute

```
set DBUS_VERBOSE=1
```

for getting debug infos

- call function registered in dbus

```
bin\dbus-send.exe --dest=org.freedesktop.DBus --print-reply --
type=method_call / org.freedesktop.DBus.StartServiceByName
string:org.freedesktop.DBus.TestSuiteEchoService uint32:455 method
return sender=org.freedesktop.DBus -> dest=:1.8 uint32 2
```

note: When building with the Visual C++ IDE the *.exe files are in
the bin/Debug and bin/Release folder, not in the bin folder.

FAQ

- How far is WinDBus from being usable for production ?

dbus comes with a test suite which is used on unix to guarantate
production quality and this test suite runs mostly. There are some
test not running and we need help to get them running.

In the pratice I and some other people are using dbus for at least
more

than four years in conjunction with kde on windows without any
problems.

- On UNIX D-Bus uses UNIX sockets to communicate (correct me if I'm
wrong).

What is used on Windows ?

tcp sockets, there are some efforts to get named pipe running, but some design problems of the win32 api, we are not able to solve without bigger changes to the dbus code base let us stop this effort.

- Do you have any clue if dbus-win32 can run in a Windows CE environment?

dbus has been ported to wince, see README.wince for more information

- Do you know if the C++ binding made by OpenWengo will be easily portable to Windows?

The OpenWengo dbus-c++ binding has been ported to windows see in WinDBus svn

(<http://sf.net/projects/windbus>)

The related test applicationa are running well.

TODO

Oktober 2010:

- the code wrapped with DBUS_WIN_FIXME should be inspected if it required for windows

- create a dbus setup installer

- implement system bus and system bus service starter
see <http://windbus.svn.sourceforge.net/viewvc/windbus/trunk/bus/bus-service-win.c>
for a starting point

- implement a real login session bus
The scope parameter of the autolaunch meta protocol could be extended to support user specific session busses (like already done with the amarok bundled dbus which use a shared memory area named "DBusDaemonAddressInfo:<username>".
Also the dbus installer should start a session bus on user login.

File = README.wince

DBus Daemon for Windows CE/Windows Mobile 6.5

=====

Bugs in upstream for any window version:

* MoveFileExA < 0 result check bug

* double dbus_free somewhere I forgot where (check in -ugly)

- * alignment issue
- * CreateProcess process information handle leak
- * _dbus_getsid NULL vs INVALID_HANDLE_VALUE
- * win_account_to_sid

Customisation

=====

1) At installation, the following registry value should be set to the installation directory of the dbus installation (the directory containing the bin, etc, share folders):

HKLM\Software\freedesktop\DBus\Install Directory

2) Instead of environment variable DBUS_VERBOSE, use
HKLM\Software\freedesktop\DBus\Verbose

2) The keyring directory is MYDOCUMENTS\dbus-keyrings, not
HOMEPATH\.dbus-keyrings.

Compilation

=====

```
./configure --host=arm-mingw32ce CPPFLAGS=-I/path/to/expat/include
LDFLAGS=-L/path/to/expat/lib
```

A recent version of libtool is required, with this change:

2010-02-28 Pierre Ossman <ossman@ossman.lkpg.cendio.se> (tiny change)

Ralf Wildenhues <Ralf.Wildenhues@gmx.de>

```
Fix deplibs check fallback for 64-bit Windows and Windows CE.
* libltdl/m4/libtool.m4 (_LT_CHECK_MAGIC_METHOD): Accept file
formats
'pe-arm-wince' and 'pe-x86-64'. Add note about consistency
with ...
* libltdl/config/ltmain.m4sh (func_win32_libid): ... the
respective
pattern here; sync pattern from the former.
* tests/deplibs-mingw.at (deplibs without file command): New
file, new test.
* Makefile.am (TESTSUITE_AT): Update.
* NEWS: Update.
```

MB vs WCHAR

=====

Windows CE only supports the Unicode interface, while Dbus Daemon uses the Multi-Byte interface on Windows by default. The glue code does

not support multibyte in all cases. In particular, the `_mbsrchr` function is not correctly implemented. It could be correctly implemented, or dbus daemon could use the `wchar` interface more consistently on all Windows targets. For now, the Windows CE port will only work for filesystems without some weird characters in file names. Is this a serious limitation?

Known Issues =====

Autolaunch is broken so far.

Environment variables are faked. Some are punted to the registry, but in any case they can not be used reliably for IPC.

The test suite is not ported yet.

dbus-pipe.c:

- * Uses libc file descriptors. Needed for `--print-address` and `--print-pid` which probably don't work yet.

dbus-sysdeps-win.c:

- * Backtraces have been disabled.
- * `_dbus_fd_set_close_on_exec` Not supported, maybe we should disable the warning.
- * `SearchPathA`: Uses `HKLM\\Software\\freedesktop\\DBus\\Install Directory` to locate binaries.

File = README.~1~

This directory is where `.m4` files providing third-party autoconf macros can be placed to be automatically found by the `aclocal(1)` program.

The `.m4` files placed here could be shared among different versions of `aclocal`, so be careful.

Even if no actual `.m4` files are present, this directory is required in order for `aclocal` to work properly. Please do not remove it.

File = README.~2~

Sections in this file describe:

- introduction and overview
- low-level vs. high-level API
- version numbers

- options to the configure script
- ABI stability policy

Introduction

===

D-Bus is a simple system for interprocess communication and coordination.

The "and coordination" part is important; D-Bus provides a bus daemon that does things like:

- notify applications when other apps exit
- start services on demand
- support single-instance applications

See <http://www.freedesktop.org/software/dbus/> for lots of documentation, mailing lists, etc.

See also the file HACKING for notes of interest to developers working on D-Bus.

If you're considering D-Bus for use in a project, you should be aware that D-Bus was designed for a couple of specific use cases, a "system bus" and a "desktop session bus." These are documented in more detail in the D-Bus specification and FAQ available on the web site.

If your use-case isn't one of these, D-Bus may still be useful, but only by accident; so you should evaluate carefully whether D-Bus makes sense for your project.

Note: low-level API vs. high-level binding APIs

===

A core concept of the D-Bus implementation is that "libdbus" is intended to be a low-level API. Most programmers are intended to use the bindings to GLib, Qt, Python, Mono, Java, or whatever. These bindings have varying levels of completeness and are maintained as separate projects from the main D-Bus package. The main D-Bus package contains the low-level libdbus, the bus daemon, and a few command-line tools such as dbus-launch.

If you use the low-level API directly, you're signing up for some pain. Think of the low-level API as analogous to Xlib or GDI, and the high-level API as analogous to Qt/GTK+/HTML.

Version numbers

===

D-Bus uses the common "Linux kernel" versioning system, where even-numbered minor versions are stable and odd-numbered minor versions are development snapshots.

So for example, development snapshots: 1.1.1, 1.1.2, 1.1.3, 1.3.4
Stable versions: 1.0, 1.0.1, 1.0.2, 1.2.1, 1.2.3

All pre-1.0 versions were development snapshots.

Development snapshots make no ABI stability guarantees for new ABI introduced since the last stable release. Development snapshots are likely to have more bugs than stable releases, obviously.

Configuration

===

dbus could be build by using autotools or cmake.

When using autotools the configure step is initiated by running
./configure
with or without additional configuration flags.

When using cmake the configure step is initiated by running the cmake program with or without additional configuration flags.

Configuration flags

===

When using autotools, run "./configure --help" to see the possible configuration options and environment variables.

When using cmake, inspect README.cmake to see the possible configuration options and environment variables.

API/ABI Policy

===

Now that D-Bus has reached version 1.0, the objective is that all applications dynamically linked to libdbus will continue working indefinitely with the most recent system and session bus daemons.

- The protocol will never be broken again; any message bus should work with any client forever. However, extensions are possible where the protocol is extensible.
- If the library API is modified incompatibly, we will rename it as in <http://ometer.com/parallel.html> - in other words, it will always be possible to compile against and use the older API, and apps will always get the API they expect.

Interfaces can and probably will be `_added_`. This means both new functions and types in libdbus, and new methods exported to applications by the bus daemon.

The above policy is intended to make D-Bus as API-stable as other

widely-used libraries (such as GTK+, Qt, Xlib, or your favorite example). If you have questions or concerns they are very welcome on the D-Bus mailing list.

NOTE ABOUT DEVELOPMENT SNAPSHOTS AND VERSIONING

Odd-numbered minor releases (1.1.x, 1.3.x, 2.1.x, etc. - major.minor.micro) are devel snapshots for testing, and any new ABI they introduce relative to the last stable version is subject to change during the development cycle.

Any ABI found in a stable release, however, is frozen.

ABI will not be added in a stable series if we can help it. i.e. the ABI of 1.2.0 and 1.2.5 you can expect to be the same, while the ABI of 1.4.x may add more stuff not found in 1.2.x.

NOTE ABOUT STATIC LINKING

We are not yet firmly freezing all runtime dependencies of the libdbus library. For example, the library may read certain files as part of its implementation, and these files may move around between versions.

As a result, we don't yet recommend statically linking to libdbus. Also, reimplementations of the protocol from scratch might have to work to stay in sync with how libdbus behaves.

To lock things down and declare static linking and reimplementation to be safe, we'd like to see all the internal dependencies of libdbus (for example, files read) well-documented in the specification, and we'd like to have a high degree of confidence that these dependencies are supportable over the long term and extensible where required.

NOTE ABOUT HIGH-LEVEL BINDINGS

Note that the high-level bindings are separate projects from the main D-Bus package, and have their own release cycles, levels of maturity, and ABI stability policies. Please consult the documentation for your binding.

Bootstrapping D-Bus on new platforms

===

A full build of D-Bus, with all regression tests enabled and run, has some dependencies which themselves depend on D-Bus, either for compilation or for some of *their* regression tests: GLib, dbus-glib and dbus-python are currently affected.

To avoid circular dependencies, when bootstrapping D-Bus for the first time on a new OS or CPU architecture, you can either cross-compile some of those components, or choose the build order and options carefully:

- * build and install D-Bus without tests
 - do not use the --enable-modular-tests=yes configure option
 - do not use the --enable-tests=yes configure option
- * build and install GLib, again without tests
- * use those versions of libdbus and GLib to build and install dbus-glib
- * ... and use those to install dbus-python
- * rebuild libdbus; this time you can run all of the tests
- * rebuild GLib; this time you can run all of the tests

File = system-activation.txt

D-BUS System Activation

Introduction:

The dbus-daemon runs as the dbus user, and is therefore unprivileged. Earlier attempts [1] by David Zeuthen at launching system scripts using a custom DBUS protocol were reviewed, but deemed too difficult to audit, and also due to a multi-threaded design, too difficult to test. In the next few paragraphs I will outline a simpler setuid approach for launching daemons as a configured user.

Scope:

Launching programs using dbus has been a topic of interest for many months.

This would allow simple systems to only start services that are needed,

and that are automatically started only when first requested.

This removes the need for an init system, and means that we can trivially

startup services in parallel.

This has immediate pressing need for OLPC, with a longer term evaluation for

perhaps Fedora and RHEL.

Details:

Setuid applications have to be used only when absolutely necessary.

In this implementation I have a single executable,

dbus-daemon-launch-helper, with the ownership root:dbus.

This has the permissions 4750, i.e. u+rx g+rx +setuid.

It is located in /usr/libexec/ and thus is not designed to be invoked by a

user directly.

The helper must not be passed input that can be changed maliciously, and

therefore passing a random path with user id is totally out of the question.

In this implementation a similar idea as discussed with Davids' patch was

taken, that to pass a single name argument to the helper.

The service filename of "org.me.test.service" is then searched for in /usr/share/dbus-1/system-services or other specified directories.

If applications want to be activated on the system _and_ session busses, then

service files should be installed in both directories.

A typical service file would look like:

```
[D-BUS Service]
Name=org.me.test
Exec=/usr/sbin/dbus-test-server.py
User=ftp
```

This gives the user to switch to, and also the path of the executable. The service name must match that specified in the /etc/dbus-1/system.d conf file.

Precautions taken:

* Only the bus name is passed to the helper, and this is validated

* We are super paranoid about the user that called us, and what permissions we have.

- * We clear all environment variables except for DBUS_VERBOSE which is used for debugging
- * Anything out of the ordinary causes the helper to abort.

Launching services:

Trivial methods on services can be called directly and the launch helper will start the service and execute the method on the service. The launching of the service is completely transparent to the caller, e.g.:

```
dbus-send --system --print-reply          \
  --dest=org.freedesktop.Hal              \
  /org/freedesktop/Hal/Manager            \
  org.freedesktop.Hal.Manager.DeviceExists \
  string:/org/freedesktop/Hal/devices/computer
```

If you wish to activate the service without calling a well known method, the standard dbus method StartServiceByName can be used:

```
dbus-send --system --print-reply          \
  --dest=org.freedesktop.DBus             \
  /org/freedesktop/DBus                   \
  org.freedesktop.DBus.StartServiceByName \
  string:org.freedesktop.Hal uint32:0
```

[1] <http://lists.freedesktop.org/archives/dbus/2006-October/006096.html>

File = TODO

Important for 1.2
===

- System bus activation
- Windows port

Important for 1.0 GLib Bindings
===

- Test point-to-point mode
- Add support for getting sender
- format_version in the object info doesn't look like it's handled correctly. The creator of the object info should specify some fixed number per struct version; the library should handle only specific numbers it knows about. There's no assumption that all numbers \geq the given one are compatible. The idea is that new versions of the lib can offer totally different object info structs, but old versions keep working.

Important for 1.0 Python bindings
===

- Hammer down API

- Fix removing of signals from the match tree
- Fix refcounting and userdata lifecycles
- Write a generic mainloop

Might as Well for 1.0

===

- protocol version in each message is pretty silly

Can Be Post 1.0

===

- revamp dbus-launch a bit,
see <http://lists.freedesktop.org/archives/dbus/2006-October/005906.html>
for some thoughts.
- clean up the creds issue on *BSD's in dbus/dbus-sysdeps-unix.c.
They should work as is but we need to rearrange it to make it clearer which method is being used. configure.in should be fixed up to make that decision.
- `_dbus_connection_unref_unlocked()` is essentially always broken because
the connection finalizer calls non-unlocked functions. One fix is to make
the finalizer run with the lock held, but since it calls out to the app that may
be pretty broken. More likely all the uses of `unref_unlocked` are just wrong.
- if the GUID is obtained only during authentication, not in the address,
we could still share the connection
- Allow a `dbus_g_proxy_to_string()/g_object_to_string()` that would convert the proxy to an "IOR" and `dbus_g_proxy_from_string()` that would decode; using these, dbus-glib users could avoid `DBusConnection` entirely. Of course the same applies to other kinds of binding. This would use `dbus_connection_open()`'s connection-sharing
feature to avoid massive proliferation of connections.
- `DBusWatchList/TimeoutList` duplicate a lot of code, as do `protected_change_watch/protected_change_timeout` in `dbus-connection.c`
and `dbus-server.c`. This could all be mopped up, cut-and-paste fixed, code size reduced.

- change .service files to allow Names=list in addition to Name=string
 - The message bus internal code still says "service" for "name", "base service" for "unique name", "activate" for "start"; would be nice to clean up.
 - Property list feature on message bus (list of properties associated with a connection). May also include message matching rules that involve the properties of the source or destination connection.
 - Disconnecting the remote end on invalid UTF-8 is probably not a good idea. The definition of "valid" is slightly fuzzy. I think it might be better to just silently "fix" the UTF-8, or perhaps return an error.
 - build and install the Doxygen manual in Makefile when --enable-docs
 - if you send the same message to multiple connections, the serial number will only be right for one of them. Probably need to just write() the serial number, rather than putting it in the DBusMessage, or something.
 - perhaps the bus driver should have properties that reflect attributes of the session, such as hostname, architecture, operating system, etc. Could be useful for code that wants to special-case behavior for a particular host or class of hosts, for example.
 - currently the security policy stuff for messages to/from the bus driver is kind of strange; basically it's hardcoded that you can always talk to the driver, but the default config file has rules for it anyway, or something. it's conceptually screwy at the moment.
 - when making a method call, if the call serial were globally unique, we could forward the call serial along with any method calls made as a result of the first method call, and allow reentrancy that was strictly part of the call stack of said method call. But I don't really see how to do this without making the user pass around the call serial to all method calls all the time, or disallowing async calls.
- If done post 1.0 will probably be an optional/ugly-API type of thing.
- I don't want to introduce DBusObject, but refcounting and object data could still be factored out into an internal "base class" perhaps.

- Keep convenience wrappers in sync with bus methods
- document the auth protocol as a set of states and transitions, and then reimplement it in those terms
- recursive dispatch, see `dbus_connection_dispatch()`
- do we need per-display activation; if so I'd like to do this by setting a "display ID" property on screen 0, with a GUID, and keying activation by said GUID. Otherwise you get all kinds of unrobust string/hostname-based mess. per-screen is then done by appending screen number to the display. If displays have a deterministic ID like this, you can do per-display by simply including GUID in the service name.
- optimization and profiling!
- Match rules aren't in the spec (probably a lot of methods on the bus are not)
- the "break loader" and valid/invalid message tests are all disabled; they need to be fixed and re-enabled with the new message args stuff. I think I want to drop the .message files thing and just have code that generates messages, more like the tests for `dbus-marshal-recursive.c` (this is mostly done now, just needs some cleanup)
- just before 1.0, try a `HAVE_INT64=0` build and be sure it runs
- Windows port needs recursive mutexes

Should Be Post 1.0

===

- look into supporting the concept of a "connection" generically (what does this TODO item mean?)
- test/name-test should be named test/with-bus or something like that

Apache License 2.0

Version 2.0, January 2004

Terms and Conditions for Use, Reproduction, and Distribution

1. Definitions.

'License' shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

'Licensor' shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

'Legal Entity' shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, 'control' means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

'You' (or 'Your') shall mean an individual or Legal Entity exercising permissions granted by this License.

'Source' form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

'Object' form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

'Work' shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

'Derivative Works' shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

'Contribution' shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, 'submitted' means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as 'Not a Contribution.'

'Contributor' shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

You must give any other recipients of the Work or Derivative Works a copy of this License; and

You must cause any modified files to carry prominent notices stating that You changed the files; and

You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

If the Work includes a 'NOTICE' text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an 'AS IS' BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability.

While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets '[']' replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same 'printed page' as the copyright notice for easier identification within third-party archives.
